# SAFETY PRECAUTIONS

(Read these precautions before using this product.)

Before using this product, please read this manual and the relevant manuals carefully and pay full attention to safety to handle the product correctly.

The precautions given in this manual are concerned with this product only. For the safety precautions for the programmable controller system, refer to the user's manual for the module used and the MELSEC iQ-R Module Configuration Manual.

In this manual, the safety precautions are classified into two levels: "⚠ WARNING" and "⚠ CAUTION".

|                                                                                                  |                                                                                                                             |
|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
|  <b>WARNING</b> | Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.                      |
|  <b>CAUTION</b> | Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage. |

Under some circumstances, failure to observe the precautions given under "⚠ CAUTION" may lead to serious consequences.

Observe the precautions of both levels because they are important for personal and system safety.

Make sure that the end users read this manual and then keep the manual in a safe place for future reference.

## [Design Precautions]

---

### **WARNING**

---

- Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.
    - (1) Emergency stop circuits, protection circuits, and protective interlock circuits for conflicting operations (such as forward/reverse rotations or upper/lower limit positioning) must be configured external to the programmable controller.
    - (2) When the programmable controller detects an abnormal condition, it stops the operation and all outputs are:
      - Turned off if the overcurrent or overvoltage protection of the power supply module is activated.
      - Held or turned off according to the parameter setting if the self-diagnostic function of the CPU module detects an error such as a watchdog timer error.
    - (3) All outputs may be turned on if an error occurs in a part, such as an I/O control part, where the CPU module cannot detect any error. To ensure safety operation in such a case, provide a safety mechanism or a fail-safe circuit external to the programmable controller. For a fail-safe circuit example, refer to the MELSEC iQ-R Module Configuration Manual.
    - (4) Outputs may remain on or off due to a failure of a component such as a relay and transistor in an output circuit. Configure an external circuit for monitoring output signals that could cause a serious accident.
  - In an output circuit, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
  - Configure a circuit so that the programmable controller is turned on first and then the external power supply. If the external power supply is turned on first, an accident may occur due to an incorrect output or malfunction.
  - Configure a circuit so that the external power supply is turned off first and then the programmable controller. If the programmable controller is turned off first, an accident may occur due to an incorrect output or malfunction.
  - For the operating status of each station after a communication failure, refer to manuals for the network used. For the manuals, please consult your local Mitsubishi representative. Incorrect output or malfunction due to a communication failure may result in an accident.
  - When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents. When a Safety CPU is used, data cannot be modified while the Safety CPU is in SAFETY MODE.
  - Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
-

## [Design Precautions]

---

### **WARNING**

- Do not write any data to the "system area" and "write-protect area" of the buffer memory in the module. Also, do not use any "use prohibited" signals as an output signal from the CPU module to each module. Doing so may cause malfunction of the programmable controller system. For the "system area", "write-protect area", and the "use prohibited" signals, refer to the user's manual for the module used. For areas used for safety communications, they are protected from being written by users, and thus safety communications failure caused by data writing does not occur.
  - If a communication cable is disconnected, the network may be unstable, resulting in a communication failure of multiple stations. Configure an interlock circuit in the program to ensure that the entire system will always operate safely even if communications fail. Incorrect output or malfunction due to a communication failure may result in an accident. When safety communications are used, an interlock by the safety station interlock function protects the system from an incorrect output or malfunction.
- 

## [Design Precautions]

---

### **CAUTION**

- Do not install the control lines or communication cables together with the main circuit lines or power cables. Doing so may result in malfunction due to electromagnetic interference. Keep a distance of 100mm or more between those cables.
  - During control of an inductive load such as a lamp, heater, or solenoid valve, a large current (approximately ten times greater than normal) may flow when the output is turned from off to on. Therefore, use a module that has a sufficient current rating.
  - After the CPU module is powered on or is reset, the time taken to enter the RUN status varies depending on the system configuration, parameter settings, and/or program size. Design circuits so that the entire system will always operate safely, regardless of the time.
  - Do not power off the programmable controller or do not reset the CPU module while the settings are being written. Doing so will make the data in the flash ROM or SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM or the SD memory card again. Doing so may cause malfunction or failure of the module.
  - When changing the operating status of the CPU module from external devices (such as the remote RUN/STOP functions), select "Do Not Open by Program" for "Opening Method" of "Module Parameter". If "Open by Program" is selected, an execution of the remote STOP function causes the communication line to close. Consequently, the CPU module cannot reopen the line, and external devices cannot execute the remote RUN function.
-

## [Security Precautions]

---

### **WARNING**

- To maintain the security (confidentiality, integrity, and availability) of the programmable controller and the system against unauthorized access, denial-of-service (DoS) attacks, computer viruses, and other cyberattacks from external devices via the network, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.
- 

## [Installation Precautions]

---

### **WARNING**

- Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may result in electric shock or cause the module to fail or malfunction.
- 

## [Installation Precautions]

---

### **CAUTION**

- Use the programmable controller in an environment that meets the general specifications in the MELSEC iQ-R Module Configuration Manual. Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
  - To mount a module, place the concave part(s) located at the bottom onto the guide(s) of the base unit, and push in the module until the hook(s) located at the top snaps into place. Incorrect interconnection may cause malfunction, failure, or drop of the module.
  - To mount a module with no module fixing hook, place the concave part(s) located at the bottom onto the guide(s) of the base unit, push in the module, and fix it with screw(s). Incorrect interconnection may cause malfunction, failure, or drop of the module.
  - When using the programmable controller in an environment of frequent vibrations, fix the module with a screw.
  - Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction. For the specified torque range, refer to the MELSEC iQ-R Module Configuration Manual.
  - When using an extension cable, connect it to the extension cable connector of the base unit securely. Check the connection for looseness. Poor contact may cause malfunction.
  - When using an SD memory card, fully insert it into the SD memory card slot. Check that it is inserted completely. Poor contact may cause malfunction.
-

## [Installation Precautions]

---

### **CAUTION**

---

- Securely insert an extended SRAM cassette or a battery-less option cassette into the cassette connector of the CPU module. After insertion, close the cassette cover and check that the cassette is inserted completely. Poor contact may cause malfunction.
  - Beware that the module could be very hot while power is on and immediately after power-off.
  - Do not directly touch any conductive parts and electronic components of the module, SD memory card, extended SRAM cassette, battery-less option cassette, or connector. Doing so can cause malfunction or failure of the module.
- 

## [Wiring Precautions]

---

### **WARNING**

---

- Shut off the external power supply (all phases) used in the system before installation and wiring. Failure to do so may result in electric shock or cause the module to fail or malfunction.
- After installation and wiring, attach a blank cover module (RG60) to each empty slot before powering on the system for operation. Also, attach an extension connector protective cover<sup>\*1</sup> to each unused extension cable connector as necessary. Directly touching any conductive parts of the connectors while power is on may result in electric shock.

<sup>\*1</sup> For details, please consult your local Mitsubishi Electric representative.

---

## [Wiring Precautions]

---

### **CAUTION**

---

- Individually ground the FG and LG terminals of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
  - Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
  - Check the rated voltage and signal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause fire or failure.
  - Connectors for external devices must be crimped or pressed with the tool specified by the manufacturer, or must be correctly soldered. Incomplete connections may cause short circuit, fire, or malfunction.
  - Securely connect the connector to the module. Poor contact may cause malfunction.
  - Do not install the control lines or communication cables together with the main circuit lines or power cables. Doing so may result in malfunction due to noise. Keep a distance of 100mm or more between those cables.
  - Place the cables in a duct or clamp them. If not, dangling cables may swing or inadvertently be pulled, resulting in malfunction or damage to modules or cables.  
In addition, the weight of the cables may put stress on modules in an environment of strong vibrations and shocks.  
Do not clamp the extension cables with the jacket stripped. Doing so may change the characteristics of the cables, resulting in malfunction.
  - Check the interface type and correctly connect the cable. Incorrect wiring (connecting the cable to an incorrect interface) may cause failure of the module and external device.
  - Tighten the terminal screws or connector screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, fire, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, fire, or malfunction.
  - When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.
  - When wiring, shield the module using a cover or similar means to prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction. Remove the shield for heat dissipation before operating the system.
  - When a protective film is attached to the top of the module, remove it before system operation. If not, inadequate heat dissipation of the module may cause a fire, failure, or malfunction.
-

## [Wiring Precautions]

---

### **CAUTION**

- Programmable controllers must be installed in control panels. Connect the main power supply to the power supply module in the control panel through a relay terminal block. Wiring and replacement of a power supply module must be performed by qualified maintenance personnel with knowledge of protection against electric shock. For wiring, refer to the MELSEC iQ-R Module Configuration Manual.
  - For Ethernet cables to be used in the system, select the ones that meet the specifications in the user's manual for the module used. If not, normal data transmission is not guaranteed.
- 

## [Startup and Maintenance Precautions]

---

### **WARNING**

- Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
  - Correctly connect the battery connector. Do not charge, disassemble, heat, short-circuit, solder, or throw the battery into the fire. Also, do not expose it to liquid or strong shock. Doing so will cause the battery to produce heat, explode, ignite, or leak, resulting in injury or fire.
  - Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal screws, connector screws, or module fixing screws. Failure to do so may result in electric shock.
-

## [Startup and Maintenance Precautions]

---

### **CAUTION**

- When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.
  - Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
  - Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.
  - Use any radio communication device such as a cellular phone or PHS (Personal Handy-phone System) more than 25cm away in all directions from the programmable controller. Failure to do so may cause malfunction.
  - Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may cause the module to fail or malfunction.
  - Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
  - After the first use of the product, do not perform each of the following operations more than 50 times (IEC 61131-2/JIS B 3502 compliant).  
Exceeding the limit may cause malfunction.
    - Mounting/removing the module to/from the base unit
    - Inserting/removing the extended SRAM cassette or battery-less option cassette to/from the CPU module
    - Mounting/removing the terminal block to/from the module
    - Connecting/disconnecting the extension cable to/from the base unit
  - After the first use of the product, do not insert/remove the SD memory card to/from the CPU module more than 500 times. Exceeding the limit may cause malfunction.
  - Do not touch the metal terminals on the back side of the SD memory card. Doing so may cause malfunction or failure of the module.
  - Do not touch the integrated circuits on the circuit board of an extended SRAM cassette or a battery-less option cassette. Doing so may cause malfunction or failure of the module.
  - Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.
-

## [Startup and Maintenance Precautions]

---

### **CAUTION**

- Startup and maintenance of a control panel must be performed by qualified maintenance personnel with knowledge of protection against electric shock. Lock the control panel so that only qualified maintenance personnel can operate it.
  - Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Wearing a grounded antistatic wrist strap is recommended. Failure to discharge the static electricity may cause the module to fail or malfunction.
  - After unpacking, eliminate static electricity from the module to prevent electrostatic discharge from affecting the module. If an electrostatically charged module comes in contact with a grounded metal object, a sudden electrostatic discharge of the module may cause failure.  
For details on how to eliminate static electricity from the module, refer to the following.  
 Safety Precautions For Static Electricity Before Using MELSEC MX Controller MX-R Model and MELSEC iQ-R Series Models (FA-A-0368)
  - Use a clean and dry cloth to wipe off dirt on the module.
- 

## [Operation Precautions]

---

### **CAUTION**

- When changing data and operating status, and modifying program of the running programmable controller from an external device such as a personal computer connected to an intelligent function module, read relevant manuals carefully and ensure the safety before operation. Incorrect change or modification may cause system malfunction, damage to the machines, or accidents.
  - Do not power off the programmable controller or reset the CPU module while the setting values in the buffer memory are being written to the flash ROM in the module. Doing so will make the data in the flash ROM or SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM or SD memory card again. Doing so can cause malfunction or failure of the module.
-

## [Computer Connection Precautions]

---

### **CAUTION**

- When connecting a personal computer to a module having a USB interface, observe the following precautions as well as the instructions described in the manual for the personal computer used. Failure to do so may cause the module to fail.
    - (1) When the personal computer is AC-powered
      - When the personal computer has a 3-pin AC plug or an AC plug with a grounding wire, connect the plug to a grounding receptacle or ground the grounding wire. Ground the personal computer and the module with a ground resistance of 100 ohms or less.
      - When the personal computer has a 2-pin AC plug without a grounding wire, connect the computer to the module by following the procedure below. For power supplied to the personal computer and the module, using the same power source is recommended.
        1. Unplug the personal computer from the AC receptacle.
        2. Check that the personal computer is unplugged. Then, connect the personal computer to the module with a USB cable.
        3. Plug the personal computer into the AC receptacle.
    - (2) When the personal computer is battery-powered
      - The personal computer can be connected to the module without taking specific measures. For details, refer to the following.
-  **Cautions When Using Mitsubishi Electric Controllers or GOTs Connected to a Personal Computer Via RS-232C/USB Interface (FA-A-0298)**
- When the USB cable used is the GT09-C30USB-5P manufactured by Mitsubishi Electric, specific measures are not required to connect the AC-powered personal computer to the module. However, note that the signal ground (SG) is common for the module and its USB interface. Therefore, if an SG potential difference occurs between the module and the connected devices, it causes failures of the module and the connected devices.
- 

## [Disposal Precautions]

---

### **CAUTION**

- When disposing of this product, treat it as industrial waste.
  - When disposing of batteries, separate them from other wastes according to the local regulations. For details on battery regulations in EU member states, refer to the MELSEC iQ-R Module Configuration Manual.
- 

## [Transportation Precautions]

---

### **CAUTION**

- When transporting lithium batteries, follow the transportation regulations. For details on the regulated models, refer to the MELSEC iQ-R Module Configuration Manual.
  - The halogens (such as fluorine, chlorine, bromine, and iodine), which are contained in a fumigant used for disinfection and pest control of wood packaging materials, may cause failure of the product. Prevent the entry of fumigant residues into the product or consider other methods (such as heat treatment) instead of fumigation. The disinfection and pest control measures must be applied to unprocessed raw wood.
-

# CONDITIONS OF USE FOR THE PRODUCT

---

- (1) MELSEC programmable controller ("the PRODUCT") shall be used in conditions;
- i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident; and
  - ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.
- (2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries. MITSUBISHI ELECTRIC SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI ELECTRIC USER'S, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT.
- ("Prohibited Application")
- Prohibited Applications include, but not limited to, the use of the PRODUCT in;
- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
  - Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
  - Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.
- Notwithstanding the above restrictions, Mitsubishi Electric may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi Electric and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTS are required. For details, please contact the Mitsubishi Electric representative in your region.
- (3) Mitsubishi Electric shall have no responsibility or liability for any problems involving programmable controller trouble and system trouble caused by DoS attacks, unauthorized access, computer viruses, and other cyberattacks.

# INTRODUCTION

---

Thank you for purchasing the Mitsubishi Electric MELSEC iQ-R series programmable controllers.

This manual describes the functions and programming to use the module listed below.

Before using the product, please read this manual and relevant manuals carefully and develop familiarity with the performance of MELSEC iQ-R series programmable controller to handle the product correctly.

When applying the example programs provided in this manual to an actual system, ensure the applicability and confirm that it will not cause system control problems.

Please make sure that the end users read this manual.

## **Point**

The program examples shown in this manual are the examples in which C24 is assigned to the input/output No. X/Y0 to X/Y1F unless otherwise specified. To use the program examples shown in this manual, the input/output number assignment is required. For details on the assignment of input/output number, refer to the following manual.

 MELSEC iQ-R Module Configuration Manual

# TERMS

Unless otherwise specified, this manual uses the following terms.

| Term                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3C frame<br>(Formats 1 to 4)<br>4C frame<br>(Formats 1 to 4) | A message format for C24 for data communications with ASCII code data using the MC protocol<br>This is the same message format as the communication frame using the dedicated protocol for the QnA series Serial Communication Module.<br><ul style="list-style-type: none"> <li>• QnA compatible 3C frame (Formats 1 to 4): QnA frame (Formats 1 to 4)</li> <li>• QnA compatible 4C frame (Formats 1 to 4): QnA extension frame (Formats 1 to 4)</li> </ul>                      |
| 4C frame<br>(Format 5)                                       | A message format for C24 for data communication with binary code data using the MC protocol<br>This is the same message format as the communication frame using the dedicated protocol for the QnA series Serial Communication Module.<br><ul style="list-style-type: none"> <li>• QnA compatible 4C frame (Format 5): QnA extension frame (Format 5)</li> </ul>                                                                                                                  |
| Bidirectional protocol                                       | A data communication function to communicate any data between a CPU module and the target device using the communication procedure for C24                                                                                                                                                                                                                                                                                                                                        |
| Buffer memory                                                | A memory of an Intelligent function module to store data (including setting value and monitored value) sent to/receive from CPU module                                                                                                                                                                                                                                                                                                                                            |
| BUFRCVS                                                      | An abbreviation for Z.BUFRCVS                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| C24                                                          | Another term for the MELSEC iQ-R series Serial Communication Module                                                                                                                                                                                                                                                                                                                                                                                                               |
| CPRTCL                                                       | An abbreviation for G.CPRTCL or GP.CPRTCL                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CPU module                                                   | A generic term for MELSEC iQ-R series CPU module                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CSET                                                         | An abbreviation for ZP.CSET                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Data communication function                                  | A generic term for data communication functions using MC protocol, predefined protocol, nonprocedural protocol, bidirectional protocol, MODBUS, and simple CPU communication                                                                                                                                                                                                                                                                                                      |
| Engineering tool                                             | A tool for setting, programming, debugging, and maintaining programmable controllers<br>For the supported tools, refer to the following manual.<br> MELSEC iQ-R Module Configuration Manual                                                                                                                                                                                                     |
| GETE                                                         | An abbreviation for G.GETE or GP.GETE                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Independent operation                                        | A mode of interface operation to communicate data with the target device with a function specified in each communication protocol setting without interaction between two interfaces of C24                                                                                                                                                                                                                                                                                       |
| INPUT                                                        | An abbreviation for G.INPUT                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Intelligent function module                                  | A generic term for modules which has functions other than input and output, such as A/D converter module and D/A converter module                                                                                                                                                                                                                                                                                                                                                 |
| Interlink operation                                          | A mode of interface operation to communicate data with the target device with the two interfaces linked one another when two interfaces of C24 are connected to target devices respectively<br>The two interfaces communicate data with the same data communication function (MC protocol (identical format) or nonprocedural protocol) and the same transmission specifications. (Interlink operation of the predefined protocol and the bidirectional protocol is not allowed.) |
| MC protocol                                                  | An abbreviation for MELSEC communication protocol, which is a name of communication method to access a CPU module form a target device using the communication procedure for Serial communication modules or Ethernet communication modules                                                                                                                                                                                                                                       |
| Multidrop connection                                         | A name of connection when more than one target devices or other C24s are connected on a 1:n basis or an m:n basis using the RS-422/485 interface of C24                                                                                                                                                                                                                                                                                                                           |
| Nonprocedural protocol                                       | A data communication function to communicate any data between a CPU module and the target device using user's communication procedure                                                                                                                                                                                                                                                                                                                                             |
| ONDEMAND                                                     | An abbreviation for G.ONDEMAND or GP.ONDEMAND                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OUTPUT                                                       | An abbreviation for G.OUTPUT or GP.OUTPUT                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Packet                                                       | A data string used for communication with a target device by predefined protocol                                                                                                                                                                                                                                                                                                                                                                                                  |
| Predefined protocol                                          | A data communication function to send/receive data using a protocol of the target device for data communication between C24 and the target device<br>This setting is configured with GX Works3 (the predefined protocol support function).                                                                                                                                                                                                                                        |
| Predefined protocol support function                         | A function available using GX Works3 (the predefined protocol support function)<br>The function includes the following: <ul style="list-style-type: none"> <li>• Setting the protocol appropriate to respective target devices</li> <li>• Writing or reading the protocol setting data to/from CPU module or C24</li> <li>• Debug support function</li> </ul>                                                                                                                     |
| PRR                                                          | An abbreviation for G.PRR or GP.PRR                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PUTE                                                         | An abbreviation for G.PUTTE or GP.PUTTE                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Redundant system with redundant extension base unit          | A redundant system that is configured using extension base unit(s)                                                                                                                                                                                                                                                                                                                                                                                                                |
| Remote head module                                           | An abbreviation for RJ72GF15-T2 CC-Link IE Field Network remote head module.                                                                                                                                                                                                                                                                                                                                                                                                      |

| Term          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

7 DEBUG SUPPORT FUNCTION

---

# 1 DATA COMMUNICATION USING MC PROTOCOL

MC protocol is a communication method for programmable controllers, which enable device data and programs in the CPU module to be read from/written to target devices via C24.

C24 returns a response message automatically based on requests from the target devices. Thus, programs for response messages are not required.

For details of the MC protocol, refer to the following manual.

 MELSEC Communication Protocol Reference Manual

## 1.1 Accessing to CPU Module Using MC Protocol

This section explains how to access to a CPU module using MC protocol.

### Reading/writing device memory of CPU module

Read/write data from/to the device memory of the access target CPU or intelligent function module buffer memory. For the accessible range, refer to the following manual.

 MELSEC Communication Protocol Reference Manual

### Reading/writing programs and parameters

This function reads and writes program files and parameter files stored in the CPU module.

### Remote control of CPU module

This function performs remote RUN/STOP/PAUSE/latch clear/reset operations.

### Monitoring of CPU module

This function monitors the operation status and data in the device memory of the CPU module.

### Transmitting data to a target device from a CPU module

This function requests data transmission from a CPU module to a target device, and transmits on-demand data to the target device.

## File access method

To access to a file, which the password setting is configured, from external devices using the MC protocol, specifying the command for file password is required.

1. Specify the password with a request message.
2. Perform the password authentication by using the specified password.

For command requiring the password authentication, specify "0040" with the setting value of "subcommand" in the request message.

| Function                | Command (subcommand) |
|-------------------------|----------------------|
| Deleting file           | 1822 (0040)          |
| Copying file            | 1824 (0040)          |
| Changing file attribute | 1825 (0040)          |
| Opening file            | 1827 (0040)          |

For more details on the commands, refer to the following manual.

 MELSEC Communication Protocol Reference Manual

## 1.2 Data Communication

MC protocol uses the following communication frames for data communication.

Transmit/receive data from the target device in the data format corresponding to the MC protocol.

For details on the communication frames format, refer to the following manual.

 MELSEC Communication Protocol Reference Manual

## Formats and codes

There are five formats for the data communication frames:

| Setting value | format   | Code of communication data | Remarks                                      | Reference                                                                                                                            |
|---------------|----------|----------------------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1             | Format 1 | ASCII code                 | —                                            |  MELSEC Communication Protocol Reference Manual |
| 2             | Format 2 | ASCII code                 | A format that a block number is added        |                                                                                                                                      |
| 3             | Format 3 | ASCII code                 | A format enclosed with STX and ETX           |                                                                                                                                      |
| 4             | Format 4 | ASCII code                 | A format that CR and LF are added at the end |                                                                                                                                      |
| 5             | Format 5 | Binary code                | This can be used only for 4C frame.          |                                                                                                                                      |

Set the format in the Communication protocol setting of an Engineering tool.

### Point

Communication using binary code shortens the communication time since the amount of communication data is about a half of the one in data communications using ASCII code.

The data communication frames are as shown below.

Select from "MC protocol (Format 1)" to "MC protocol (Format 5)" for "Communication protocol setting".

Configure other settings according to the system being used.

☞ Page 454 PARAMETER SETTING

## Applicability of remote password function

---

The remote password function prevents unauthorized access to a CPU module from a remote location.

By setting a remote password to the CPU module, this function can be applicable.

For the method for setting remote password, refer to the following manual.

 GX Works3 Operating Manual

## Using MX Component

---

MX Component is an ActiveX control library that supports various types of communication paths between a personal computer and CPU module.

By using MX Component, an arbitrary system can be configured. Furthermore, the communication program for the target device can be created without considering the content of MC protocol (transmission/reception procedures).

For details, refer to the following manuals.

 MX Component Version 4 Operating Manual

 MX Component Version 4 Programming Manual

## 2 DATA COMMUNICATION USING PREDEFINED PROTOCOL

Data can be transmitted and received between the CPU module and an target device with a protocol appropriate to the target device (such as a measuring instrument and a barcode reader).

Since devices or buffer memory data can be taken into communication packets, this protocol communication is suitable for data that may change every transmission.

The protocol setting required to communicate with the target device is configured in Engineering tool.

Protocols can be selected from the predefined protocol library offered or can be arbitrarily created and edited.

In addition, since the registered setting data is written to the CPU built-in memory, SD memory card, or flash ROM, the program size in the CPU module can be reduced.

For an example of data communication using the predefined protocol, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module User's Manual(Startup)

### Data communication using the predefined protocol

#### Point

The number of protocols and packets that can be registered are as follows:

- Protocols: Up to 128
- Packets: Up to 256

Depending on the packet to be registered, the maximum numbers of packets above may not be registered.

The usage rate of the packet data area differs depending on the types of protocol.

It can be confirmed on the status bar of the "Protocol Setting" screen displayed by following the procedure as follows:

- Select [Tool] ⇒ [Predefined Protocol Support Function] of Engineering tool, and set "Module Type" and "Connection Destination CPU" on the "Predefined Protocol Support Function" window. And, add the protocol on the "Predefined Protocol Support Function" screen.

## 2.1 Data Communication Procedure

By using the Predefined protocol support function, data can be communicated with a target device in the following procedure.

2

### Operating procedure

1. Select a protocol in "Predefined Protocol Support Function", and write the protocol setting data.

 Page 32 Creating protocol setting data

2. Set the module parameter to "Predefined protocol".

 Page 37 Setting method

3. Execute the protocol written with the dedicated instruction (CPRTCL).

 MELSEC iQ-R Serial Communication Module User's Manual(Startup)

4. Monitor the executed protocol in the Protocol execution log.

The transmitted/received data and the communication control signal status can also be checked using the Circuit trace function.

 MELSEC iQ-R Serial Communication Module User's Manual(Startup)

### Restriction

Communication using the modem function is not available for the predefined protocol.

## Creating protocol setting data

Create a protocol setting data using the Predefined protocol support function.

### ■Selecting target module of a protocol setting data

Select a target module of the protocol setting data.

🖱️ Engineering tool [Tool] ⇒ [Predefined Protocol Support Function]

### ■Creating new protocol setting data

Create new protocol setting data.

🖱️ [File]⇒[New]

| Item               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol No.       | Displays the protocol number to be used for a predefined protocol dedicated instruction in programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Manufacturer       | Displays the manufacture's name of a device to which a protocol to be set is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Model              | Displays the model name of a device to which a protocol to be set is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Protocol Name      | Displays the name of a protocol to be set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Communication Type | Displays the communication type in a protocol to be set. <ul style="list-style-type: none"><li>• Send Only: Send one send packet once.</li><li>• Receive Only: Receive a packet if it matches any of up-to-16 registered receive packets.</li><li>• Send&amp;Receive: Send one send packet, and receives a packet if it matches any of up-to-16 registered receive packets.</li></ul>                                                                                                                                                                                                   |
| →Send/←Receive     | Displays the packet direction. <ul style="list-style-type: none"><li>• →: For 'Send'</li><li>• ←(1) to (16): For 'Receive', a receive packet number is displayed in ().</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                       |
| Packet Name        | Displays the packet name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Packet Setting     | Displays the existence or non-existence of variables in an element, and set or unset of the variables.<br>With 'Variable Unset', 'Element Unset', or 'Element error', the settings cannot be written to a CPU module or C24. <ul style="list-style-type: none"><li>• No Variable: There is no variable in the element.</li><li>• Variable Set: All variables are set.</li><li>• Variable Unset: There are one or more unset variables.</li><li>• Element Unset: There is no element in the editable protocol.</li><li>• Element error: The element does not meet requirement.</li></ul> |

## ■Adding protocols

Add a protocol.

 [Edit] ⇨ [Add Protocol]

Adds new protocol.

Selection of Protocol Type to Add

Type : Predefined Protocol Library Reference

\* Select from Predefined Protocol Library.  
Please select manufacturer, model and protocol name from Protocol to Add.

Protocol to Add

| Protocol No. | Manufacturer        | Model          | Protocol Name         |
|--------------|---------------------|----------------|-----------------------|
| 1            | MITSUBISHI ELECTRIC | FREQROL Series | H7B RD Operation Mode |

OK Cancel

| Item                        | Description                                            | Setting range                                                                                                                       |
|-----------------------------|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Type                        | Select a protocol type to be added.                    | <ul style="list-style-type: none"> <li>• Predefined Protocol Library</li> <li>• User Protocol Library</li> <li>• Add New</li> </ul> |
| Protocol No.                | Set the number of the protocol to be added.            | 1 to 128                                                                                                                            |
| Manufacturer <sup>*1</sup>  | Set a manufacturer's name of the protocol to be added. | —                                                                                                                                   |

| Receive Setting                            | Clear OS area (receive data area) before protocol execution | Select whether to clear the OS area (receive data area) of the module before the protocol execution.<br>If 'Disable' is selected, the data received in the module before the protocol execution also become a receive target of the protocol.                                                                                         |
|                                            | Receive Wait Time                                           | Set waiting time after the module turns to the 'waiting for reception' status.<br>If the communication with target devices is not available due to such as a cable disconnection and no matched packet can be received within the set time, the module determines an error and cancels the 'waiting for reception' status.            |
| Send Setting                               | Number of Send Retries                                      | Set the number of times the module retries to send when the sending from the module has not been completed within the set time of "Monitoring Time".<br>The module determines an error if the sending has not been completed despite the specified number of times of sending retries.                                                |
|                                            | Send Retry Interval                                         | Set the interval between the failure of sending from the module and the retry when the sending from the module has not been completed within the set time of "Monitoring Time".                                                                                                                                                       |
|                                            | Standby Time                                                | Set standby time between when a protocol set to the module turns to the execution status and when it actually sends the data. By setting this item, the send timing of the module can be adjusted to readiness of target devices to receive data.                                                                                     |
|                                            | Monitoring Time                                             | Set waiting time between when the module turns to the 'sending' status and when the sending is completed.<br>If the communication with target devices is not available due to such as a cable disconnection and the sending cannot be completed within the set time, the module determines an error and cancels the 'sending' status. |

<sup>\*1</sup> For a protocol selected from the predefined protocol library, "Connected Device Information" and "Protocol Setting Information" cannot be modified.

●Processing when the data transmitted error occurred (when the number of send retries is set to '2')

When the set value of "Number of Retries" is 2, the module determines an error at the following timing if it cannot send the data.

The communication parameters can be set for multiple protocols by clicking the [Communication Parameter Batch Setting] button and setting "Setting Protocol No. Range", "Receive Setting", or "Send Setting".

The screenshot shows the 'Communication Parameter Batch Setting' dialog box. It has three main sections: 'Setting Protocol No. Range', 'Receive Setting', and 'Send Setting'. The 'Setting Protocol No. Range' section shows 'Protocol No.' set to 1 to 1. The 'Receive Setting' section has 'Clear OS area (receive data area) before protocol execution' checked and 'Receive Wait Time' set to 0 x 100ms. The 'Send Setting' section has 'Number of Send Retries' set to 0, 'Send Retry Interval' set to 500 x 10ms, 'Standby Time' set to 0 x 10ms, and 'Monitoring Time' set to 200 x 100ms. There are 'OK' and 'Cancel' buttons at the bottom.

■Setting packets

The screen above is an example when "Predefined Protocol Library" is selected on the "Add protocol" screen.  
When "Add New" or "User Protocol Library" is selected, press the [Change Type] button or [Add New] button to configure the packet.  
For details of packet elements, refer to the following section.  
🖱️ Page 39 Packet

## ■Writing protocol setting data

Write data of the protocol settings to a CPU module or C24.

 [Online] ⇒ [Write to Module]

Write the protocol setting data after selecting the module to be written and memory.

When writing data to the CPU module, the protocol setting data is written to "Module Extended Parameter".

### Point

The following data is not displayed even when reading from CPU module because it will not be written as a protocol setting data. However, the protocol selected from the predefined library is displayed.

- Manufacturer
- Packet name
- Type, Version, Explanation in the protocol detailed setting
- Element name in the packet setting

The operation when the predefined protocol setting is written to a multiple target memory is as follows:

- When the predefined protocol setting is written to both CPU built-in memory and an SD memory card

The CPU module operates according to the settings of "Memory Card Parameter". For details on the "Memory Card Parameter", refer to the following manual.

 MELSEC iQ-R Programmable Controller CPU Module User's Manual

- When the predefined protocol setting is written to a CPU built-in memory or an SD memory card, and C24

The predefined protocol settings of the CPU built-in memory or SD memory card is enabled in the following timing. (If the predefined protocol settings are written both CPU built-in memory and SD memory card, the CPU module operates according to the settings of "Memory Card Parameter".

When the predefined protocol is enabled, the predefined protocol settings of C24 will be overwritten with the predefined protocol of CPU built-in memory or SD memory card.

- When the power is turned OFF→ON
- When the CPU module is reset
- When the CPU module is switched STOP→RUN

## Setting method

Set the predefined protocol settings in "Various control specification" of "Basic Settings". ( Page 454 PARAMETER SETTING)

 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

1. Set the "Communication protocol setting" in "Various control specification" to "Predefined protocol".
2. Set the required parameters other than above.

## Dedicated instruction to be used

Use the CPRTCL instruction.

# 2.2 Communication Type of Protocols

A send packet to the target devices and a receive packet from the target devices at the time of process execution are registered in a protocol.

The packet elements which are set to the Predefined protocol support function is applied to the actual data portion of the packet to be transmitted.

For details of packet elements, refer to the following section.

☞ Page 39 Packet elements

**Ex.**

Example of a packet configuration

With the Predefined protocol support function, communications with target devices are performed using the following procedures (communication types).

| Communication type name | Processing                                                                                                                                                              |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send Only               | Sends a send packet once.<br>One send packet is required.                                                                                                               |
| Receive Only            | Receives a packet if it matches any of up to 16 defined receive packets.<br>One or more receive packets are required.                                                   |
| Send & Receive          | Sends a send packet, and then receives a packet if it matches any of up to 16 defined receive packets.<br>One send packet and one or more receive packets are required. |

For the operation of each operation type, refer to the following section.

☞ Page 581 Operation Image and Data Structure of Predefined Protocol

# 2.3 Packet

A packet consists of packet elements.  
Up to 32 elements can be set in a packet, and the maximum data length is 2048 bytes per packet.

## Packet elements

The following explains the details of the packet elements.  
For data examples on packet elements, refer to the following section.  
☞ Page 587 Data examples of packet elements

### Header

Use this element when a specific code or character string exists at the head of a packet.

- When sending: Sends a specified code and character string.
- When receiving: Verifies a header and received data.

| Item          | Description                                                                                                                                                                                                                                                                                        | Remarks                                                                                                                                      |

| Code Type     | Select a data type of the setting value.<br>ASCII String/ASCII Control Code/HEX                                                                                                                                                                                                                    | —                                                                                                                                            |
| Setting Value | Set data within 1 to 50 bytes.<br>The setting ranges that can be set for each code type are as follows: <ul style="list-style-type: none"><li>• ASCII String: 20H to 7EH</li><li>• ASCII Control Code: 00H to 1FH, and control code of 7FH</li><li>• HEX: hexadecimal data of 00H to FFH</li></ul> | Setting example <ul style="list-style-type: none"><li>• ASCII String: 'ABC'</li><li>• ASCII Control Code: STX</li><li>• HEX : FFFF</li></ul> |

- Only one header can be used in a packet.
- A header can be set only at the head of a packet.

## Static Data

Use this element when a specific code or character string such as command exists in a packet.

- When sending: Sends a specified code and character string.
- When receiving: Verifies the received data.

| Item          | Description                                                                                                                                                                                                                                                                                        | Remarks                                                                                                                                     |

| Code Type     | Select a data type of the setting value.<br>ASCII String/ASCII Control Code/HEX                                                                                                                                                                                                                    | —                                                                                                                                           |
| Setting Value | Set data within 1 to 50 bytes.<br>The setting ranges that can be set for each code type are as follows: <ul style="list-style-type: none"><li>• ASCII String: 20H to 7EH</li><li>• ASCII Control Code: 00H to 1FH, and control code of 7FH</li><li>• HEX: hexadecimal data of 00H to FFH</li></ul> | Setting example <ul style="list-style-type: none"><li>• ASCII String: 'ABC'</li><li>• ASCII Control Code: US</li><li>• HEX : FFFF</li></ul> |

Multiple static data elements can be placed to desired positions in the data portion.

## Terminator

Use this element when a code or character string indicating the end of the packet is included.

| Item          | Description                                                                                                                                                                                                                                                                                        | Remarks                                                                                                                                      |

| Setting Value | Set data within 1 to 50 bytes.<br>The setting ranges that can be set for each code type are as follows: <ul style="list-style-type: none"><li>• ASCII String: 20H to 7EH</li><li>• ASCII Control Code: 00H to 1FH, and control code of 7FH</li><li>• HEX: hexadecimal data of 00H to FFH</li></ul> | Setting example <ul style="list-style-type: none"><li>• ASCII String: 'ABC'</li><li>• ASCII Control Code: ETX</li><li>• HEX : FFFF</li></ul> |

- Only one terminator can be used in a packet.
- Only a check code and static data can be placed after a terminator.

## Length

Use this element when an element indicating the data length is included in a packet.

- When sending: Calculates the data length of a specified range, and adds the result to a send packet.
- When receiving: Verifies the data (value) corresponds to the length in the received data as the data length of a specified range.

| Item              | Description                                                                |                                                                                                                                                                                                                                      | Remarks                                     |

### Point

- Only one length can be used in a packet.
- When there is no element other than a length, an element error occurs.
- When the number of digits of calculation result is greater than that specified in "Data Length", digits greater than the specified digit are omitted (ignored).  
Example) When "2 bytes" is specified in "Data Length" and the calculation result is "123 bytes", the data length is considered as "23".
- When any of a Non-conversion variable (Variable length), Conversion variable (Variable number of data), Conversion variable (Fixed number of data/Variable number of digits<sup>\*1</sup>), and Non-verified reception (Variable number of characters) is placed behind a Length and they are not included in the calculating range of the Length, place any of the following data immediate after the Non-conversion variable (Variable length), Conversion variable (Variable length) or Non-verified reception.  
Static Data  
Terminator  
Check code + Static Data  
Check code + Terminator
- When "Code Type" is "ASCII Hexadecimal", a corresponding packet is regarded as a mismatch packet if a string except for '0' to '9', 'A' to 'F', and 'a' to 'f' is received.
- When "Code Type" is "ASCII Decimal", a corresponding packet is regarded as a mismatch packet if a string except for '0' to '9' is received.

\*1 Excluding a case where "Number of Send Data" is '1' and "Delimiter" is not 'No delimiter'.

## Non-conversion Variable

Use this element to send the data in the device memory of a CPU module or buffer memory as a part of a send packet, or store a part of a receive packet to the device memory of a CPU module or buffer memory.

| Item                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

\*1 Do not set local devices.

\*2 Set within the device range specified in the following screen.

Project window ⇒ [Parameter] ⇒ CPU module type ⇒ [CPU Parameter] ⇒ [Memory/Device Setting]

The following explains the configuration of the data storage area.

### ■When "Fixed Length/Variable Length" is "Fixed Length"

An area starting from the device number which is specified on the "Element Setting" screen is considered as the data storage area.

The data storage area to be occupied varies depending on the setting of "Unit of Stored Data".

- When "Lower Byte + Upper Byte" is selected, the same size as the data length is occupied.  
(However, when the data length of a send packet is an odd number, the upper byte (lower byte for "Byte Swap") of the last device is not sent. When the data length of a receive packet is an odd number, the last data is stored with one byte of 00H added.)
- When "Lower Bytes Only" is selected, twice the size of the data length is occupied.

### ■When "Fixed Length/Variable Length" is "Variable Length"

An area starting from the device number which is specified on the "Element Setting" screen +1 is considered as the data storage area.

The data storage area to be occupied varies depending on the setting of "Unit of Stored Data".

- When "Lower Byte + Upper Byte" is selected, the same size as the data length + one word (length for the data length storage area) are occupied.  
(However, when the data length of a send packet is an odd number, the upper byte (lower byte for "Byte Swap") of the last device is not transmitted. When the data length of a receive packet is an odd number, one byte of 00H is added to the last data and stored.)
- When "Lower Bytes Only" is selected, twice size of the data length + one word (length for the data length storage area) are occupied.

\*1 The unit of data length is byte.

## Precautions

- When receiving variable length data whose length exceeds the "Maximum data length", C24 stores data as long as the maximum data length and omits the rest. (A protocol completes successfully.)
- Out of packet data received from target devices, the data corresponding to variable needs to be discriminated from a terminator or a static data immediately after non-conversion variable. The reception processing may not be performed normally if they cannot be discriminated.

### Ex.

When value of a terminator or value of a static data following a non-conversion variable is used in a non-conversion variable, C24 recognizes it as data of a terminator or a static data following a non-conversion variable and performs the verification/reception processing.

- Multiple Non-conversion variable (Fixed length) elements can be placed in a packet, and multiple Non-conversion variable (Variable length) elements can also be placed in a send packet. However, only one Non-conversion variable (Variable length) can be placed in a receive packet, and any of the following requirements need to be met.

- Place any of the following items immediate after the non-conversion variable.

Static Data

Terminator

Check code + Static Data

Check code + Terminator

- Place a Length before a Non-conversion variable and include the Non-conversion variable in the calculating range.

In addition, two or more of the following four elements cannot be placed in the same packet.

- Variable number of data [Conversion variable]
- Fixed number of data and variable number of digits [Conversion variable] (Excluding a case where "Number of Send Data" is '1' and "Delimiter" is not 'No delimiter'.)
- Variable length [Non-conversion variable]
- Variable number of characters [Non-verified reception]

## Conversion Variable

This element converts the numerical data in the device memory of a CPU module or buffer memory to an ASCII string and sends it, or converts the received data (ASCII string) to the numerical data and stores it to the device memory of a CPU module or buffer memory.

| Data Storage Area Specification | Specify a start device to store variable value. |                                                                                                                                    |

The following explains the configuration of the data storage area.

### ■When "Fixed Number of Data/Variable Number of Data" is "Fixed Number of Data"

An area starting from the device number which is specified on the "Element Setting" screen is considered as the data storage area.

### ■When "Fixed Number of Data/Variable Number of Data" is "Variable Number of Data"

An area starting from the device number which is specified on the "Element Setting" screen +1 is considered as the data storage area.

### ■Occupied size in data storage area

The size occupied in the data storage area varies depending on the settings of "Conversion Unit" and "Number of Decimals".

| Setting item    |                              | Occupied size in data storage area per one data |
|-----------------|------------------------------|-------------------------------------------------|
| Conversion Unit | Number of Decimals           |                                                 |
| Word            | No Decimal point/Fixed point | 1 word                                          |
|                 | Variable point               | 2 words                                         |
| Double Word     | No Decimal point/Fixed point | 2 words                                         |
|                 | Variable point               | 4 words                                         |

## ■Data storage area configuration per one data

The following shows the data storage area configuration per one data.

- "Conversion Unit": Word, "Number of Decimals": No decimal Point/Fixed point

- "Conversion Unit": Word, "Number of Decimals": Variable point

For 'Variable Point', the decimal point position is set in the data storage area.

In the decimal point position area, the decimal point position is set as follows.

| Send/receive data (number of digits of data is 5) | Numeric data  | Decimal point position |
|---------------------------------------------------|---------------|------------------------|
| 12345                                             | 12345 (3039H) | 1 (1H)                 |
| 1234.5                                            | 12345 (3039H) | 10 (0AH)               |
| 123.45                                            | 12345 (3039H) | 100 (64H)              |
| 12.345                                            | 12345 (3039H) | 1000 (3E8H)            |
| 1.2345                                            | 12345 (3039H) | 10000 (2710H)          |

- "Conversion Unit": Double word, "Number of Decimals": No Decimal Point/Fixed point

- "Conversion Unit": Double word, "Number of Decimals": Variable Point

For 'Variable Point', the decimal point position is set in the data storage area.

In the decimal point position area, the decimal point position is set as follows.

| Send/receive data (number of digits of data is 10) | Numeric data           | Decimal point position |
|----------------------------------------------------|------------------------|------------------------|
| 1234567890                                         | 1234567890 (499602D2H) | 1 (1H)                 |
| 123456789.0                                        | 1234567890 (499602D2H) | 10 (0AH)               |
| 12345678.90                                        | 1234567890 (499602D2H) | 100 (64H)              |
| 1234567.890                                        | 1234567890 (499602D2H) | 1000 (3E8H)            |
| :                                                  | :                      | :                      |
| 1.234567890                                        | 1234567890 (499602D2H) | 1000000000 (3B9ACA00H) |

## ■Range of value that can be used in the data storage area

The following table shows the range of value that can be used in the data storage area.

| Conversion                                         | Sign     | Conversion unit | Range of value                                                      |
|----------------------------------------------------|----------|-----------------|---------------------------------------------------------------------|
| HEX → ASCII decimal<br>ASCII decimal → HEX         | Unsigned | Word            | 0 to 65535 (0H to FFFFH)                                            |
|                                                    |          | Double word     | 0 to 4294967295 (0H to FFFFFFFFH)                                   |
|                                                    | Signed   | Word            | -32768 to 32767 (8000H to FFFFH, 0H to 7FFFH)                       |
|                                                    |          | Double word     | -2147483648 to 2147483647 (80000000H to FFFFFFFFH, 0H to 7FFFFFFFH) |
| HEX → ASCII hexadecimal<br>ASCII hexadecimal → HEX | —        | Word            | 0H to FFFFH                                                         |
|                                                    |          | Double word     | 0H to FFFFFFFFH                                                     |

## ■Considerations for configuring packet element

To place a Conversion variable in a packet, the following requirements need to be met.

- To place Conversion variable in send packet

Multiple Conversion variable elements can be placed in one packet, and they can be placed in desired positions in the data portion.

- To place Conversion variable in receive packet

Multiple Conversion variable elements can be placed in one packet in the cases other than "Variable number of data" and (3) of "Fixed number of data".

|                                                                                                                                                 |                                  |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Precautions

An error may occur on C24 in any of the following cases.

- A string other than '0'-'9', 'A'-'F', or 'a'-'f' is received

When "Conversion" is "ASCII Hexadecimal→HEX", an ASCII → BIN conversion error (7F20H) may occur if a string other than '0'-'9', 'A'-'F', or 'a'-'f' is received.

- A string other than '0'-'9' is received

When "Conversion" is "ASCII Decimal→HEX", an ASCII → BIN conversion error (7F20H) may occur if a string other than '0'-'9' is received. However, the error does not occur in the following cases.

| Item                | C24 operation                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sign/Sign Character | When "Signed" is selected, a signed character can be received.<br>However, when a signed character which is not at the head of data is received, an ASCII → BIN conversion error (7F20H) may occur.                                                                                                                                                                                                                |
| Number of Decimals  | When any other than "No decimal point" is selected, '.' (a period) can be received.<br>However an ASCII → BIN conversion error (7F20H) may occur when '.' (a period) which is not at the specified number of digits of data is received.<br>An ASCII → BIN conversion error (7F20H) may also occur when "Variable point" is selected and '.' (a period) which is at the head or end of a unit of data is received. |
| Delimiter           | When any other than "No delimiter" is selected, a delimiter can be received.<br>However an ASCII → BIN conversion error (7F20H) may occur when a delimiter which is not at a boundary of data is received.                                                                                                                                                                                                         |

- A data of which number of digits exceeds the upper limit is received

When "Number of Send Digits of Data" is "Variable Number of Digits", an abnormal digit number error (7D19H) may occur if the number of digits of received data exceeds the upper limit shown below.

| Conversion unit | Conversion              | Upper limit of number data to be received |
|-----------------|-------------------------|-------------------------------------------|
| Word            | ASCII Decimal → HEX     | 5 digits                                  |
|                 | ASCII Hexadecimal → HEX | 4 digits                                  |
| Double word     | ASCII Decimal → HEX     | 10 digits                                 |
|                 | ASCII Hexadecimal → HEX | 8 digits                                  |

- A data whose decimal point position is greater than the number of digits is specified

When "Number of Decimals" is 'Variable Point' in a send packet, a decimal point place specification error (7D21H) may occur if the decimal point position is greater than the number of digits.

- A data whose number of digits is '0' is received

When "Number of Send Digits of Data" is "Variable Number of Digits", an abnormal digit number error (7D19H) may occur if the number of digits of received data is '0'.

- A data whose number of digits are fewer than the digits specified in "Number of Send Digits of Data" are received

An insufficient digit number error (7D18H) may occur if data whose number of digits are fewer than the digits specified in "Number of Send Digits of Data" are received.

Example) When "Number of Send Digits of Data" is set to 4 digits

- A data whose number exceeds "Maximum number of data" is received

When receiving data of which the number exceeds the "Maximum number of data", C24 stores data as many as the maximum number of data and omits the rest. (A protocol completes successfully.)

- A data that cannot be distinguished between Terminator or a Static data

In received packet data from target devices, C24 needs to be able to discriminate data corresponding to a Conversion variable from those of a Terminator or a Static data following a Conversion variable.

The reception processing may not be performed normally if they cannot be distinguished.

Example) When the value of Terminator or a Static data following the Conversion variable is used as a Conversion variable, C24 recognized it as a fixed data following the Conversion variable, verify, and perform reception processing.

## Check Code

Use this element when an element indicating check code data is included in a packet.

C24 automatically calculates a specified check code at timing of sending/receiving, and adds it to a send packet or detects an error of a receive packet.

Element Setting - Check Code(Send)

|                           |                                              |

|                        | End                                                                                               | Select the end packet element number for the calculating range.<br>The range is 1 to 32.                                                                                                                                                                                                                  |                                                                                                                     |

## Precautions

- When "Code Type" is "ASCII Hexadecimal", an ASCII → BIN conversion error (7F20H) may occur if a string except for '0' to '9' 'A' to 'F' 'a' to 'f' is received.
- When "Code Type" is "ASCII Decimal", an ASCII → BIN conversion error (7F20H) may occur if a string except for '0' to '9' is received.
- Only one check code can be placed in a packet.
- Packet elements placed behind a check code cannot be included in the calculating range.
- A check code cannot be included in the calculated range.
- When a calculated check code (Sum check/Horizontal parity/16-bit CRC) does not match a received check code, a sum check error (7F24H) may occur.
- One or more elements are required before a check code.

## Non-verified reception

Use this element when received data includes unnecessary data while receiving data.

C24 skips characters as many as the specified number if a receive packet includes a non-verified reception.

| Item         | Description                                |                                                                                                 |
|--------------|--------------------------------------------|-------------------------------------------------------------------------------------------------|
| Element Name | Set a name of the element.                 |                                                                                                 |
| Data Length  | 0 (variable number of characters)          | Set this item when the number of characters not to be verified varies in each of communication. |
|              | 1 to 2048 (specified number of characters) | Set the number of characters not to be verified.                                                |

## Precautions

- When "Data Length" is '0', the following requirements need to be met.
  - Only one Non-verified reception can be placed in a packet.
  - Include a Non-verified reception in the calculating range of a Length. Otherwise, place any of the following data immediate after a Non-verified reception.
    - Static Data
    - Terminator
    - Check code + Static Data
    - Check code + Terminator
  - Two or more of the following four elements cannot be placed in the same packet.
    - "Conversion Variable" (variable number of data)
    - Conversion variable (Fixed number of data and Variable number of digits) (Excluding a case when the number of data is '1' with delimiter.)
    - Non-conversion variable (Variable length)
    - Non-verified reception (Variable number of characters)
- In received packet data from target devices, C24 needs to be able to discriminate data corresponding to a Non-verified reception from those of a Terminator or a Static Data following a Non-verified reception. The receive processing may not be performed normally if they cannot be distinguished.
 

Ex.) When value of a Terminator or value of a Static Data following a Non-verified reception is used in a Non-verified reception, C24 recognizes it as data of a Terminator or a Static Data following a Non-verified reception and performs the verify/receive process.

# 2.4 Execution Condition of Predefined Protocol Communication

The predefined protocol communication can be performed when the 'predefined protocol ready' (X1D) is ON.  
When executing the predefined protocol communication in the program, use the 'predefined protocol ready' (X1D) as an interlock signal.  
This signal turns ON only when the communication protocol setting is set to predefined protocol

## ON/OFF timing of predefined protocol ready (X1D)

After the protocol setting data is written to a flash ROM, 'predefined protocol ready' (X1D) turns OFF while checking the written data.  
When the written data is normal, 'predefined protocol ready' (X1D) turns ON.

## Execution timing for mode switching request signal (Y2/Y9) or UINI instruction

It is assumed that the protocol setting data written to the flash ROM is normal, or the protocol setting data is not written to the flash ROM.

### ■Execution timing for mode switching request signal (Y2/Y9)

Communication protocol before change: CH1 and CH2 are other than the predefined protocol mode.

Communication protocol after change: CH1 or CH2 is the predefined protocol mode.

Communication protocol before change: CH1 or CH2 is the predefined protocol mode.

Communication protocol after change: CH1 or CH2 is the predefined protocol mode.

Communication protocol before change: CH1 or CH2 is the predefined protocol mode.

Communication protocol after change: CH1 and CH2 are other than the predefined protocol mode.

## ■Execution timing for UINI instruction

Communication protocol before change: CH1 and CH2 are other than the predefined protocol mode.

Communication protocol after change: CH1 or CH2 is the predefined protocol mode.

Communication protocol before change: CH1 or CH2 is the predefined protocol mode.

Communication protocol after change: CH1 or CH2 is the predefined protocol mode.

Communication protocol before change: CH1 or CH2 is the predefined protocol mode.

Communication protocol after the change: CH1 and CH2 are other than the predefined protocol mode.

# 3 DATA COMMUNICATION USING NONPROCEDURAL PROTOCOL

Nonprocedural protocol enables to transmit and receive data between a CPU module and target device by setting a data format and transmission control procedure arbitrarily.

A program for data communication is required for the CPU module.

Use this protocol for data communication with any given data format.

## Point

The predefined protocol is recommended for data communication appropriate to the protocol of the target device, such as a measuring instrument or barcode reader.

Communication using the nonprocedural protocol can be replaced with that of the predefined protocol.

The predefined protocol support function of Engineering tool allows the easy replacement.

With the predefined protocol, the required program is only for starting communication according to the specified protocol, and this can reduce the number of steps considerably.

For the communication using the predefined protocol, refer to the following chapter.

➞ Page 30 DATA COMMUNICATION USING PREDEFINED PROTOCOL

## Parameter settings of data communication using nonprocedural protocol

Set the transmission setting and the communication protocol, etc. for a target device.

Set the "Nonprocedural protocol" for "Communication protocol setting".

🔍 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings"  
⇒ "Various control specification"

Configure other settings according to the system being used.

For details of the settings, refer to the following chapter.

➞ Page 454 PARAMETER SETTING

## 3.1 Receiving Data from Target Device

This section explains data reception from a target device.

### Receiving methods

The following shows the methods for receiving data in any format using the nonprocedural protocol.

There are two methods for receiving data: the 'reception by receive end code' for receiving variable length messages, and the 'reception by receive end data quantity' for receiving fixed length messages. If the receive end code and the receive end data quantity are not determined, the 'reception by time out for the no-reception monitoring time (timer 0)' is also available.

The receive end code and receive end data quantity used for data reception can be changed to any setting values by the user using Engineering tool.

C24 turns the 'CH□ reception data read request' (X3/XA) ON when it receives the receive end code before data equivalent to the receive end data quantity has been received.

Therefore, when receiving data using the receive end code, set a value which is bigger than the maximum number of data sent from the target device in the receive end data quantity designation.

For the changing methods for the receive end code and receive end data quantity, refer to the following section.

☞ Page 77 Receive end data quantity and receive end code settings

| Method                                                               | Application                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reception by the receive end code                                    | Receives variable length messages                                                                                                                                                                                                                           |
| Reception by receive end data quantity                               | Receives fixed length messages.                                                                                                                                                                                                                             |
| Reception by time out for the no-reception monitoring time (timer 0) | Receives messages the receive end code and the receive end data quantity of which are not determined. For specifying a no-reception monitoring time (timer 0), refer to the following section.<br>☞ Page 260 No-reception Monitoring Time (timer 0) Setting |

| Description                         | CH1/CH2 | Control timing |
|-------------------------------------|---------|----------------|
| Reception data read request         | X3/XA   |                |
| INPUT instruction                   |         |                |
| INPUT instruction completion device |         |                |

① When data is received from the target device using either 'reception by receive end code' or 'reception by receive end data quantity' method, the CH□ reception data read request' (X3/XA) turns ON.

② Control data is stored in the device designated with the INPUT instruction.

③ When the INPUT instruction is executed, received data is read from the receive data storage area of the buffer memory.

## Data reception by receive end code (for variable length reception)

This method is used to transmit data by adding the receive end code set in C24 at the end of a message transmitted from a target device.

The receive end code can be changed according to the specifications of the target device. Arbitrary 1-character (1-byte) code within the range of 00H to FFH can be designated.

| Setting         | Description                                                         | Remarks                                                                                                  |
|-----------------|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| 0D0AH (default) | The receive end code is not changed.                                | CR, LF is added to the end of the message and sent from the target device.                               |
| □□H             | Arbitrary code is designated for the receive end code. (00H to FFH) | The designated receive end code data is added to the end of the message and sent from the target device. |
| FFFFH           | No receive end code                                                 | Data reception by receive end data quantity is available.                                                |

- When C24 receives the receive end code data preset with Engineering tool by the user, it issues a reception data read request to the program.

The read request from C24 allows the program to read the received data up to the receive end code received from the target device.

- C24 issues a reception data read request to the CPU module in the cases below, according to the setting value of the receive end code.

### ■When receive end code is not changed (Default value: 0D0AH)

(CR+LF is added to the end of the message and sent from the target device.)

- When LF is received within the time set in the no-reception monitoring time (timer 0) after CR is received, C24 stores the receive data up to CR+LF to the receive data storage area in the buffer memory and turns ON the 'CH□ reception data read request' (X3/XA) to the CPU module.

- If LF is not received within the time set in the no-reception monitoring time (timer 0) after CR is received, C24 stores the received data up to CR to the receive data storage area on the buffer memory, and turns ON the following signals to the CPU module.

Nonprocedural and no-reception monitoring time

Method 0 : 'CH□ reception abnormal detection' (X4/XB)

Method 1 : 'CH□ reception data read request' (X3/XA)\*1

\*1 It is used when a message of which receive end code and receive end data quantity have not been determined due to the non-reception monitoring time (timer 0) time out in the nonprocedural protocol. (Page 261 Nonprocedural no-reception monitoring time method designation (Method 0/1))

\*2 CR is handled as 1-byte data in the message.

### ■When the receive end code is changed and an arbitrary code is designated (designate from 0000H to 00FFH)

(User defined receive end code data is added to the end of the message and transmitted from the target device).

When C24 receives the receive end code data changed by the user, it stores the received data up to the receive end code in the receive area on the buffer memory and turns ON the 'CH□ reception data read request' (X3/XA) to the CPU module.

### ■When the receive end code is not designated (FFFFH designated)

Reading by the receive end data quantity is enabled.

For more information on reading by the receive end data quantity, refer to the following section.

☞ Page 59 Data reception by receive end data quantity (for fixed length reception)

### Data reception by receive end data quantity (for fixed length reception)

- This method is used to receive messages of the same length (size) from the target device every time.
- When C24 receives data equivalent to the receive end data quantity preset with Engineering tool by the user, it issues a reception data read request to the program.  
Upon the read request by the C24, the program reads the data equivalent to the receive end data quantity from the target device.
- The receive end data quantity default value is set to 511 (words). However, it can be changed within the receive data storage area depending on the data contents exchanged with the target device.

# Receive area and receive data arrangement

The following shows the receive area and the receive data arrangement for performing data reception using the nonprocedural protocol.

## Receive area

The receive area is a memory area for storing the data received from the target device, and the receive data quantity to read the received data to the CPU module.

By default, the receive area is assigned to the addresses, Un\G1536 to 2047 (CH1 side) and Un\G2560 to 3071 (CH2 side).

The position and size of the receive area in the buffer memory can be changed with Engineering tool in accordance with the specifications of the target device and the receive data length. (Page 454 PARAMETER SETTING)

Configure the settings as follows:

Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

- Designate the start address for the area to be used as receive area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) to "Receiving buffer memory start address designation".
- Designate the length of area to be used as the receive area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) by address count (0001H to 1A00H) to "Receiving buffer memory size specification".

When changing the position and size of the receive area in the buffer memory, if any of the functions below are used concurrently, make sure that the addresses of the receive area do not overlap with the buffer memory addresses assigned for storing send/receive data with the functions.

- MC protocol buffer memory read/write function
- MC protocol on-demand function
- Predefined protocol function (Send/receive data storage area)
- Nonprocedural protocol transmission/reception function
- Bidirectional protocol transmission/reception function
- Send/receive data monitoring function

Set the size of data per data transmission from the target device to C24 to be equal to or smaller than the size of the receive data storage area in the buffer memory.

- (Receive data storage area) ≥ (Amount of data in any data portion to be transmitted from the target device)

To transmit data whose size is larger than the receive data storage area, increase the receive area, or divide the send data before sending.

### Point

The position and size of the receive area can be changed in the buffer memory.

- 'Receiving buffer memory start address designation' (Un\G166/326)
- 'Receive buffer memory length designation' (Un\G167/327)

## Receive data arrangement

The following explains the data arrangement when data received from a target device is stored to the receive area.

- The received message is stored to the C24 buffer memory (Receive data storage area).
- The data is stored to the receive data storage area in the order of data reception from (L)→(H) of the low address to (L)→(H) of the next address.

Under the following conditions, when the receive end data quantity is an odd byte, 00H is stored in the upper byte of the last data storage position:

When the unit for the receive end data quantity is designated in bytes.

When data reception is performed using the receive end code.

**Ex.**

When receive data "ABCDEFG123" was stored (The receive area is the default value.)

\*1 The OS area of C24 is the memory (8448 bytes) that temporarily stores the data to be received while a reception data read request is being issued to the CPU module. (Reading received data in the OS area cannot be performed by the user.)

When the program finishes reading the received data in the buffer memory in response to the current read request, the received data in the OS area, and any succeeding received data, is stored successively in the receive area in the buffer memory when the next read request is issued.

Also, when the free OS area, which stores the received data, is reduced to 64 bytes (default value) or less, a request to discontinue data transmission from the target device is issued by the following transmission control (The RS (RTS) signal does not turn OFF):

·When DTR control is set, the ER(DTR) signal turns OFF.

·When DC1/DC3 control is set, DC3 is sent.

When there is no more free OS area to store received data, SIO error occurs and the SIO information bit of the 'CH□ side LED lighting status and communication error status' (Un\G513/514) turns ON. In that case, succeeding received data is discarded until a free area becomes available in the OS area.

For more details on the transmission control, refer to the following section.

☞ Page 268 DATA COMMUNICATIONS USING DC CODE TRANSMISSION CONTROL

## Reception operation

### ■Data reception when the receive data storage area > receive data length

**Ex.**

When data of 511 words or less is received by the CH1 side interface on the condition that the receive area for the CH1 interface is Un\G1536 to 2047 (default value)

### ■Data reception when the receive data storage area < receive data length (Reception using the receive end code)

The data link processing is required in the program.

**Ex.**

When data of 534 words is received by the CH1 side interface on the condition that the receive area for the CH1 interface is Un\G1536 to 2047 (default value).

### ■Data reception when the receive data storage area < receive data length (Reception by receive end data quantity)

If a specified receive end data quantity is bigger than the receive data storage area, the 'receive buffer memory length designation' (Un\G167/327, default: 512) minus 1 is used as the receive end data quantity instead.

(Receive data storage area) > (Data length transmitted from the target device)

**Ex.**

When 550 words of data is received by the CH1 interface three times on the condition that the receive area for the CH1 interface is Un\G1536 to 2047 (default value).

# Program for data reception

## Program example for data reception

The following shows the program for data reception using the nonprocedural protocol and its example.  
 For details on the INPUT instruction, refer to the dedicated instructions. (Page 580 Dedicated Instructions)

\*1 When the completion device is OFF, execute the INPUT instruction.  
 When INPUT instruction is executed when the completion device is ON, data may not be received properly.

❶ Start the programmable controller of the host station. The setting values specified with an Engineering tool are stored in C24.

❷ When the amount of data specified by the receive end data quantity or data containing the receive end code is received from the target device, the 'CH1 reception data read request' (X3) turns ON.

❸ After the control data for the INPUT instruction is stored in the device, the program executes the INPUT instruction and reads the received data.

Before executing the INPUT instruction, check that the INPUT instruction completion device (M0) is OFF.

❹ Once reading of the received data is completed, the INPUT instruction completion device turns ON.

When the completion device + 1 (abnormal completion signal) turns ON, the error code is stored in the control data completion status (S1 + 1).

## ■Program example

| Category            | Label name/FB name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Description                                | Device |            |                       |           |  |       |                       |   |                                        |     |     |            |      |   |                                       |     |     |            |      |   |                                         |     |     |            |      |   |                                |     |     |            |       |   |                 |                                     |     |            |      |   |                            |                                     |     |            |      |   |            |                                     |     |            |      |   |                   |                                     |     |            |      |   |               |                                            |     |            |        |

For information on the module FB to be used, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module Function Block Reference

- (0) Specify the reception channel.  
Specify the allowable number of data to be received.  
Specify the execution instruction.

C24

\* When the number of received data is bigger than the allowable number of data to be received, only the data equivalent to the allowable number will be stored and the rest of the data will be discarded.

\* Data received prior to an error will be stored in the received data storage device.

### Point

- Received data can also be read by using an interrupt programs. (  Page 251 RECEIVING DATA WITH AN INTERRUPT PROGRAM)

Note that if the reading of data received from the same interface is performed, it is not possible to combine reading data by the main program and that by the interrupt program.

Use either of the above programs to read the data received.

- The SPBUSY instruction is used to read the execution status when using a dedicated instruction. (  Page 580 Dedicated Instructions)

### Restriction

- More than one INPUT instruction cannot be executed simultaneously on the same interface.  
Execute the next INPUT instruction only after the execution of the first INPUT instruction is completed.
- When the send/receive data quantity is set in word units and the receive data quantity is an odd byte when requesting the reading of received data to the CPU module, the receive data quantity is processed as follows:  
Receive data quantity = Receive data byte count/2...Round up after the decimal point.  
Also, 00H is stored in the higher byte of the last data storage position in the receive area where received data is stored.

## Reception error detection and check methods

The following explains how to detect and confirm errors that may occur when receiving data from target devices.

The following items are considered as the primary causes of errors that may occur during data reception.

| Cause of reception error                                                          | Reference                                                                                                                                          |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| A transmission error occurred due to noise.                                       |  MELSEC iQ-R Serial Communication Module User's Manual(Startup) |
| A timeout occurred for the no-reception monitoring time (timer 0).                | Page 260 No-reception Monitoring Time (timer 0) Setting                                                                                            |
| Data that could not be converted using the ASCII-BIN conversion is included.      | Page 380 ASCII-BIN Conversion for Data Communicated with Nonprocedural Protocol                                                                    |
| Data larger than the size that could be stored in the OS area of C24 is received. | Page 61 Receive data arrangement                                                                                                                   |

### Detection/checking of reception error by a program

#### ■Detecting a reception error

The following device and input signals turn ON.

- INPUT instruction completion device + 1
- 'CH□ reception abnormal detection' (X4/XB)
- 'CH□ Error occurrence' (XE/XF)

#### ■Checking a reception error

The reception error code can be checked using the INPUT instruction control data ((S1) + 1).

Or, it can be checked by reading the 'data reception result' (Un\G600/616).

For details on how to check the error code contents and corrective actions, refer to the following section.

 Page 519 Error Code List

'CH□ Error occurrence' (XE/XF) turns OFF when the data transmission/reception processing is performed normally.

### Detection/checking of reception error with module and Engineering tool

#### ■Confirmation using the indicator LED

When C24 detects an error, including a transmission error, the ERR LED turns ON.

#### ■Confirmation using Engineering tool

Monitor the 'data reception result' (Un\G600/616) to check the error code.

### Considerations

The following describes the considerations for received data in case of errors.

#### ■Storing received data

The received data for which an error was detected is discarded and only the normally received data is stored in C24.

Thus, there may be missing data among the data that has been read to the CPU module when a reception error occurs.

#### ■Reading received data

When receive data is read to the CPU module by turning the 'CH□ reception abnormal detection' (X4/XB) ON, the data that was normally received prior to the error detection is read.

Read and discard received data as needed.

When the data of "G" or later in the reception message shown in the above figure is received normally, the data is stored in the C24 OS area.

The received data stored in the OS area will be read to the CPU module in the next read operation.

## Receive data clear

For the data reception using the nonprocedural protocol, if the transmission of data from a transmitting device is interrupted due to any trouble, clearing the data received up to the present time on the receiving device side and receiving again from the first data may be required.

The methods for clearing received data in the C24 are shown below.

Use any of the methods to clear received data as necessary.

- Receive data clear request by the dedicated instruction "CSET" (  Page 70 Receive data clear with dedicated instruction "CSET")
- Write to/read from the 'receive data clear request' (Un\G168/328). (MOV instruction) (  Page 72 Receive data clear with MOV instruction)
- Receive data clear request with Engineering tool. (  Page 76 Receive data clear request procedure using Engineering tool)

### Precautions

When transmitting data to a target device from C24, do not execute a clear request of the receive data with Engineering tool. If a receive data clear request is executed when transmitting data to a target device, C24 stops data transmission and terminates the dedicated instruction for transmission abnormally. (The transmission completion signal does not turn ON.) If a receive data clear request is executed during data reception, the data received up to that point are cleared.

### Receive data clear processing

C24 performs the following processing when the receive data clear is performed.

- C24 regards the received data up to the present time as invalid data.
- C24 clears the receive data quantity up to the present time to "0". (The receive area in the buffer memory is not initialized).
- C24 sets the status in the one prior to the start of data reception.

### Procedure for clearing the received data by the program

Using the following instructions, clear the received data by a program.

- Dedicated instruction "CSET"
- MOV instruction

For the procedure to clear received data by a program, refer to the following.

### Receive data clear with dedicated instruction "CSET"

This instruction clears the received data up to the present time without interrupting the data transmission processing.

For details on CSET instruction, refer to the dedicated instruction. (  Page 580 Dedicated Instructions)

#### ■Procedure for clearing (For the CH1 side interface)

- ❶ If the CSET instruction is executed while the 'CH□ reception data read request' (X3/XA) or 'CH□ reception abnormal detection signal' (X4/XB) is ON, the CSET instruction is kept waiting until the signal is turned OFF.
- ❷ The receive data clear processing is executed to the OS area of the C24. (  Page 61 Receive data arrangement)

## Program example

The following shows the CH1 receive data clear program example using CSET instruction.

| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Setting content                         |                                             |            |            |                       |       |                       |   |                       |     |     |            |     |   |                              |                                             |     |            |    |   |                         |                                     |     |            |      |   |                                 |           |     |            |    |   |                                    |     |     |            |      |   |                                      |     |     |            |      |   |        |                                     |     |            |      |

Set the request type (receive data clear).  
Execute receive data clear.
- (17) Processing for normal completion and abnormal completion

## Receive data clear with MOV instruction

Write to/read from the 'receive data clear request' (Un\G168/328) in the procedure below with the MOV instruction.

When resuming data communication with a target device, resume it after completing the receive data clear processing with C24.

Depending on the data communication system, it may be necessary to restart data communications with the target device after notifying the target device from the CPU module that resumption of communications is possible.

### Restriction

Create a program including contacts indicating the following status (such as flag for the user) in MOV instruction.

- Contacts indicating that the 'CH□ reception data read request' (X3/XA) and 'CH□ reception abnormal detection' (X4/XB) are OFF
- Contact indicating that no dedicated instruction (OUTPUT/PRR/INPUT) is currently being executed
- Contact indicating that receive data clear processing is not currently being performed

### ■Clear Procedure (When the CH1 side interface is used)

① Write "1" to the 'receive data clear request' (Un\G168) with the MOV instruction when no data reception, data transmission, or receive data clearing processing is being performed.

② The receive data clear processing is executed to the OS area of the C24. (Page 61 Receive data arrangement)

③ When receive data clear processing is completed, the 'receive data clear request' (Un\G168) becomes "0".

## ■Program example

The following shows the CH1 receive data clear program example using MOV instruction.

The dedicated instructions (OUTPUT/INPUT) is used for data transmission/reception. (Page 580 Dedicated Instructions)

For information on the module FB to be used, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module Function Block Reference

- (6) Set the receive data clear acknowledgement flag.
- (8) Execute receive data clear processing.
- (21) Read receive data clear status.  
Reset the receive data clear acknowledgement flag.  
Reset the receive data clear in progress flag.
- (35) Set the transmission request.
- (37) Designate the transmission channel.  
Set the send data quantity.  
Set the send data (string).  
Set the send data (numeric value).  
Set the transmission request.
- (108) OUTPUT instruction normal completion
- (110) OUTPUT instruction abnormal completion
- (112) Reset the transmission processing request.  
Reset the transmission request.
- (115) Reset the OUTPUT instruction execution completion flag.  
Reset the OUTPUT instruction abnormal completion flag.

## Receive data clear request procedure using Engineering tool

The following shows the method which uses "Intelligent Function Module Monitor" of Engineering tool.

For the operation method of the Intelligent Function Module Monitor function, refer to the following manual.

 GX Works3 Operating Manual

### Operating procedure

1. Register C24 in "Intelligent Function Module Monitor".
2. Set "CH□ Receive data clear request" of "Receiving end specification" to "Requested".
3. The received data is cleared.

## Receive end data quantity and receive end code settings

### Setting method before receiving data

The following default values have been set for the receive end data quantity and receive end code that are used for data reception with the nonprocedural protocol.

| Setting data              | Default value | Allowable range                                     | Buffer memory address where the setting value is stored | Remarks                                                     |
|---------------------------|---------------|-----------------------------------------------------|---------------------------------------------------------|-------------------------------------------------------------|
| Receive end data quantity | 511 (1FFH)    | Less than the size of the receive data storage area | Un\G164/324                                             | Unit is in accordance with the word/byte units designation. |
| Receive end code          | 0D0AH (CR+LF) | 0000H to 00FFH                                      | Un\G165/325                                             | When any code is set.                                       |
|                           |               | FFFFH                                               |                                                         | When there is no receive end code.                          |

The receive end data quantity and the receive end code setting value can be changed by the program before data reception processing.

The default value can be changed in the following unit parameter of Engineering tool.

 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

For details, refer to the following section.

 Page 454 PARAMETER SETTING

### Setting method after receiving data

Other than through the setting using Engineering tool or the MOV instruction at the startup of the C24, the receive end data quantity and receive end code setting values can be changed even after data communication has started if the timing is as shown below.

The following describes the restriction of the module, and the timing and procedure for changing setting values to continue the data receive processing by changing the setting values for data reception using the nonprocedural protocol after the start of data communication.

#### How to receive data

Reception using an interrupt program <sup>\*1</sup> cannot be performed. (Transmission using a dedicated instruction (OUTPUT) can be performed.)

Data must be received by the main program.

The following shows the I/O signals.

\*1 For details on the data reception using interrupt programs, refer to the following section.

 Page 251 RECEIVING DATA WITH AN INTERRUPT PROGRAM

| Type      | Input/Output Signals |          | Signal name                  | Device that turns ON/OFF |     |
|-----------|----------------------|----------|------------------------------|--------------------------|-----|
|           | CH1 side             | CH2 side |                              | CPU module               | C24 |
| Reception | X3                   | XA       | Reception data read request  |                          | ○   |
|           | X4                   | XB       | Reception abnormal detection |                          | ○   |

#### Restriction

When the 'CH□ reception abnormal detection' (X4/XB) turns ON, read the error code from the buffer memory below, and then check the type of error and take corrective actions. ( Page 519 Error Code List)

- 'Data reception result' (Un\G600/616)

## ■Setting values that can be changed

Of the initial settings from Engineering tool stored in the buffer memory, only the following setting values can be changed after data communication has started.

- 'Receive end data quantity designation' (Un\G164/324)
- 'Receive end code designation' (Un\G165/325)

## ■Timing and procedure for changing the setting values

### ● Timing of change

To change the receive end code and receive end data quantity after data communication has started, change the setting when the status of the I/O signals relating to the reading of received data is as shown below.

- 'CH□ Reception data read request' (X3/XA) or 'CH□ reception abnormal detection' (X4/XB): ON

### ● Change procedure

When the 'CH□ reception data read request' (X3/XA)/'CH□ reception abnormal detection' (X4/XB) turns ON upon data reception from the target device, perform the following and execute the INPUT instruction.

- Change the setting values for the receive end code and the receive end data quantity.

**Ex.**

When reading data received in the CH1 side interface

## ■Program example

| Category            | Label name/FB name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Description                                | Device     |                       |            |           |       |                       |   |                                        |     |            |    |   |                                       |     |            |    |   |                                         |     |            |    |   |                                      |     |            |     |   |                                     |     |            |      |   |                                       |     |            |      |   |            |                                     |            |    |   |                             |                                     |            |    |   |               |                                            |            |     |    |                                                |     |            |      |    |                 |                                     |            |    |

For information on the module FB to be used, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module Function Block Reference

# 3.2 Transmitting Data to Target Device

This section explains data transmission from the CPU module to a target device.

## Sending methods

The following shows how to send data in any format using the nonprocedural protocol.

- 1 Send data is stored in the device designated with the OUTPUT instruction.
- 2 Control data is stored in the device designated with the OUTPUT instruction.
- 3 When the OUTPUT instruction is executed, C24 transmits the amount of data designated by the send data quantity from the send data area in ascending order of the send data area addresses.

## Send area and send data arrangement

This section explains the send area and the send data arrangement for performing data transmission using the nonprocedural protocol.

### Send area

The send area is a memory to write data and the data quantity that are transmitted from the CPU module to a target device via C24.

The send area is assigned to the address, Un\G1024 to 1535 (CH1 side), Un\G2048 to 2559 (CH2 side) by default.

The position and size of the send area in the buffer memory can be changed with Engineering tool in accordance with the specifications of the target device and the send data length. (Page 454 PARAMETER SETTING)

Configure the settings as follows:

Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

- Designate the start address for the area to be used as the send area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) to "Send buffer memory start address designation".
- Designate the length of the area to be used as the send area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) by address count (0001H to 1A00H) to "Send buffer memory size specification".

When changing the position and size of the send area in the buffer memory, if any of the functions below are used concurrently, make sure not to overlap with the buffer memory addresses assigned for storing send/receive data handled with the functions.

- MC protocol buffer memory read/write function
- MC protocol on-demand function
- Predefined protocol function (Send/receive data storage area)
- Nonprocedural protocol transmission/receive function
- Bidirectional protocol transmission/receive function
- Send/receive data monitoring function

Set the size of data per data transmission from the target device to C24 to be equal to or smaller than the size of the send data storage area in the buffer memory.

- (Send data storage area) ≥ (Amount of data in any data portion to be transmitted from C24)

To transmit data whose size is larger than the send data storage area, increase the send area, or divide the send data before sending.

The position and size of send area can be changed in the buffer memory.

- 'Send buffer memory start address designation' (Un\G162/322)
- 'Send buffer memory length designation' (Un\G163/323)

# Send data arrangement

The following example shows an arrangement of the send data to be sent to the target device when storing it in the send area.

Ex.

When transmitting 'ABCDEFGH123' (The send area is the default value.)

# Program for data transmission

## Program example for data transmission

The following shows the program for data transmission using nonprocedural protocol and its example.

For details on OUTPUT instructions, refer to the dedicated instruction. (📖 Page 580 Dedicated Instructions)

① Start the programmable controller on the host station.

The value set with Engineering tool is stored in the C24.

② Input the user data transmission command signal.

③ Executes the OUTPUT instruction after storing the send data and the control data for the OUTPUT instruction in the device.

Data is sent when the OUTPUT instruction is executed.

④ C24 transmission processing completes and the OUTPUT instruction completion device turns ON.

When the completion device + 1 (abnormal completion signal) turns ON, the error code is stored in the control data completion status (S1 + 1).

## ■Program example

| FB                  | M+RJ71C24_Output                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Sends data for specified data points. | —      |            |                       |           |  |       |                       |   |                   |     |     |            |       |   |                          |     |     |            |       |   |                        |     |     |            |       |   |                                 |     |     |            |        |   |                                      |     |     |            |        |   |                                        |     |     |            |        |   |                                 |     |     |            |        |   |                      |                                     |     |            |      |   |                        |                                     |     |            |      |    |                    |                     |     |            |       |    |                         |                                     |     |            |        |    |                                       |     |     |            |        |    |                                         |     |     |            |        |

For information on the module FB to be used, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module Function Block Reference

- (69) Reset the completion flag by an external command.

**Point**

The SPBUSY instruction is used to read the execution status when using a dedicated instruction. (Page 580 Dedicated Instructions)

**Restriction**

More than one OUTPUT instruction cannot be executed simultaneously on the same interface. Execute the next OUTPUT instruction only after the execution of the first OUTPUT instruction is completed.

## Transmission error detection and check methods

The following explains how to detect and confirm errors that may occur when sending data to target devices.

The following items are considered as the primary causes of errors that may occur during data transmission.

| Cause of transmission error                                                                  | Reference                                       |
|----------------------------------------------------------------------------------------------|-------------------------------------------------|
| A timeout occurred for the send monitoring time (timer 2).                                   | Page 265 Send Monitoring Time (timer 2) Setting |
| The send data quantity exceeding the size that can be stored in the send area is designated. | Page 81 Send area and send data arrangement     |

### Detection/checking of transmission error by a program

#### ■Detecting a transmission error

The following device and input signal turn ON.

- OUTPUT instruction completion device + 1
- 'CH□ Error occurrence' (XE/XF)

#### ■Checking a transmission error

The transmission error code can be checked using the OUTPUT instruction control data ((S1) + 1).

Or, it can be checked by reading the 'data transmission result' (Un\G599/615).

For details on how to check the error code contents and corrective actions, refer to the following section.

 Page 519 Error Code List

'CH□ Error occurrence' (XE/XF) turns OFF when the data transmission/reception processing is performed normally.

### Detection/checking of transmission error with module and Engineering tool

#### ■Confirmation using the indicator LED

When C24 detects an error, including a transmission error, the ERR LED turns ON.

#### ■Confirmation using Engineering tool

Monitor the 'data transmission result' (Un\G599/615) to check the error code.

When a transmission error occurs, the CPU module may not transmit all the designated data.

Establishing any communication procedure by the user so that normal transmission can be checked by receiving a response to data transmission is recommended.

# 3.3 Considerations for Data Communication

The following describes considerations for data communications using the nonprocedural protocol.

## Factors that initialize the C24 transmission sequence

The initial status means the status where transmission has stopped and received data has been discarded.

C24 transmission sequence initialization factors are as follows.

- When the power is turned ON, the CPU module is reset, or the C24 mode is switched.
- When the received data was cleared.

## Framing error on the target device side

When nothing is transmitted from C24 to a target device through the RS-422/485 interface, a framing error may be generated by the noise etc, on the target device side.

Send an arbitrary code first so that the target device identifies the head of the data transmitted from C24.

Check the C24 interface specifications before data communication.

## Data communications with target device using the multidrop connection

When communicating data by the multidrop connection between the target device and the CPU module in a 1:n basis, data transmitted by the target device is received by C24.

For the multidrop connection, data reception using a user frame should be performed. (📖 Page 310 Data Reception)

If data is not received by user frame, create a program that ignores (reads and discards) the received data other than the received data addressed to the host station, including the data indicating the target CPU module in the message.

Ex.

| STX   | Space | Station No. 0 | Station No. 2 | Data length (BIN data) | Data | CR    | LF    |
|-------|-------|---------------|---------------|------------------------|------|-------|-------|
| (02H) | (20H) | (30H)         | (32H)         |                        |      | (0DH) | (0AH) |

## Retry processing for data reception errors

The data when reception error occurred is discarded and only the data for the normal reception is taken into the C24.

For this reason, the received message may be missing data if reception error occurs.

To assure the correct transmission and reception of data, it is recommended that a normal/error response message is received and a response message reception timeout check is conducted for the data transmitted between the CPU module and the target device, and that measures such as retransmitting the data (transmission retry) is taken when an abnormal response is received or when an error timeout occurs.

# 4 DATA COMMUNICATION USING BIDIRECTIONAL PROTOCOL

This communication enables data transfer between a target device and a CPU module using the data format and transmission control procedure for the bidirectional protocol.

The feature of this data communication is that a response message is sent from the data receiving side to the data sending side to inform whether the communication has been completed.

Use this to check if the data communication has been completed normally.

A program for data communication is required for the CPU module.

4

## Point

Communication using the bidirectional protocol can be replaced with those of the predefined protocol. The Predefined protocol support function of Engineering tool allows the easy replacement. With the predefined protocol, the required program is only for starting communication according to the specified protocol, and this can reduce the number of steps considerably. For the communication using the predefined protocol, refer to the following chapter.

➡ Page 30 DATA COMMUNICATION USING PREDEFINED PROTOCOL

## Parameter setting for data communication using bidirectional protocol

Set the transmission setting and the communication protocol, etc. for a target device.

Set "Bidirectional protocol" for "Communication protocol setting".

Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

Configure other settings according to the system being used.

For details of the settings, refer to the following chapter.

➡ Page 454 PARAMETER SETTING

# 4.1 Receiving Data from Target Device

This section explains data reception from a target device.

## Receiving methods

The following shows how to receive data sent from the target device using the bidirectional protocol. Since the size of each message to be received is recognized using the "data length" information contained in the message, messages of any size can be sent from the target device.

- 1 When the control code ENQ is received, C24 starts data reception processing.  
When data portion for the data length is received, C24 ends the reception processing of arbitrary data portion.
  - When sum check code is enabled in the transmission setting of Engineering tool, C24 checks whether the message is normal or abnormal using the sum check code received immediately after the message and the sum check code calculated by internal processing.
  - When sum check code is disabled in the transmission setting of Engineering tool, messages are not checked using the sum check codes.
- 2 When the message has normally been received, the 'CH□ reception data read request' (X3/XA) turns ON.
  - If an error has been detected when receiving the message, C24 transmits an abnormal completion response message (NAK message) to the target device.
  - The reception data read request will not be sent to the CPU module. (The 'CH□ reception abnormal detection' (X4/XB) does not turn ON.)
- 3 C24 stores the control data in the device designated with the BIDIN instruction, and then executes the BIDIN instruction.
  - Received data is read from the receive area in the buffer memory.
- 4 When the BIDIN instruction has been executed, C24 transmits a normal completion response (ACK message) to the target device.

## Receive area, receive data arrangement and contents

This section shows the receive area and the receive data arrangement for performing data reception using the bidirectional protocol.

### Receive area

The receive area is a memory that stores the data length (receive data quantity) and data portion received from a target device.

By default, the receive area is assigned to the addresses, Un\G1536 to 2047 (CH1 side) and Un\G2560 to 3071 (CH2 side).

The position and size of the receive area in the buffer memory can be changed with Engineering tool in accordance with the specifications of the target device and the receive data length. (Page 454 PARAMETER SETTING)

Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

Configure the settings as follows:

- Designate the start address for the area to be used as receive area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) to "Receiving buffer memory start address designation".
- Designate the length of area to be used as the receive area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) by address count (0001H to 1A00H) to "Receiving buffer memory size specification".

When changing the position and size of the receive area in the buffer memory, if any of the functions below are used concurrently, make sure that the addresses of the receive area do not overlap with the buffer memory addresses assigned for storing send/receive data with the functions.

- MC protocol buffer memory read/write function
- MC protocol on-demand function
- Predefined protocol function (Send/receive data storage area)
- Nonprocedural protocol transmission/receive function
- Bidirectional protocol transmission/receive function
- Send/receive data monitoring function

Set the size of data per data transmission from the target device to C24 to be equal to or smaller than the size of the receive data storage area in the buffer memory.

- (Receive data storage area) ≥ (Amount of data in any data portion to be transmitted from the target device)

To transmit data whose size is larger than the receive data storage area, increase the receive area, or divide the send data before sending.

The position and size of the receive area can be changed in the buffer memory.

- 'Receiving buffer memory start address designation' (Un\G166/326)
- 'Receive buffer memory length designation' (Un\G167/327)

Receive data arrangement

The following shows the example of the arrangement of data received from the target device when it is stored in the receive area.

- The received message is stored to the C24 buffer memory (Receive data storage area).
- The data is stored in the receive data storage area in the order of the data reception from low address, (L) → (H), to next address, (L) → (H).

Ex.

When received data "ABCDEFG123" was stored (for the CH1 side)

When the data length unit is in bytes, 00H is stored in the higher byte of the last data storage position in the receive area when the data length of the message is an odd byte.

## Contents of received data

The following shows the contents of data to be received, including data to be transmitted. (  Page 100 Send area and send data arrangement)

### ■Control codes

The types of control codes are shown in the table below.

| Signal name | Code (hexadecimal) | Description          | Application                                                                                                                         |
|-------------|--------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ENQ         | 05H                | Enquiry              | Code for starting data transmission                                                                                                 |
| ACK         | 06H                | Acknowledge          | Response code to the target side when data was received normally                                                                    |
| NAK         | 15H                | Negative Acknowledge | Response code to the target side when data could not be received normally (Error code is sent immediately after the response code.) |

- Target device → C24  
C24 checks and processes the control code received.  
It cannot be read from the program.
- C24 → target device  
C24 adds the control code to be transmitted.

### ■Data length

This indicates the number of bytes or words for the data portion of the message.

The unit of data length (words/bytes) is in accordance with the word/byte units designation with Engineering tool.

- Target device → C24  
C24 checks the length of the data received.  
When the reception is normal, C24 stores the received data in the receive data storage area in the C24 buffer memory, assigning the first byte as the lower byte (L).
- C24 → target device  
The length of data to be transmitted is the send data quantity designated by the program using the BIDOUT instruction.  
C24 transmits this value as is from the lower byte (L).

### ■Data portion

This consists of an array of original one-byte data to be transmitted to the target device side, which can handle 00H to FFH code data.

- Target device→C24  
If the receive data portion is normal, C24 takes the codes as is and stores them in the receive data storage area in sequence, beginning with the lowest address.  
The storage size is in accordance with the data length in the message and the word/byte units designation with Engineering tool.
- C24 → target device  
The portion of data to be transmitted is the send data designated by the program using the BIDOUT instruction.  
C24 transmits the data for the send data quantity according to the word/byte units designation with Engineering tool from the lowest address in the send data specification area using the code as is.

## ■Sum check code

The sum check code expresses the numeric value for the lower two bytes (16 bits) of the results (sum) from the addition of the data length and the data portion in the message as binary code data.

When sum check code is enabled in the transmission setting of Engineering tool, it is necessary to add a sum check code at the end of the message.

- Target device → C24

C24 checks and processes the sum check code received. It cannot be read from the program.

When "None" is specified for "Sum check code", once data portion of message corresponding to the data length is received, the succeeding data received will be ignored up to the control code that follows.

- C24 → target device

C24 calculates and adds the sum check code to be transmitted.

When "None" is specified, no sum check code is transmitted.

**Ex.**

Sum check code when "ABCDEFGHIJ" and the numeric value 100 are sent as data (when the unit is in bytes.)

## ■Error code

The error code indicates the definition of the error during NAK response.

For details on the error codes, refer to the following section.

☞ Page 519 Error Code List

- Target device → C24

For error codes from the target device, transmit the codes specified by the user.

The error codes (0022H to 005FH) that are not used by C24 can be used.

C24 stores the received error codes as a completion status in the control code for the BIDOUT instruction. They are also stored in the 'data transmission result' (Un\G599).

- C24 → target device

C24 adds an error code.

When an error code is transmitted, C24 writes the same error code in the 'data reception result' (Un\G600).

# Program for data reception

## Program example for data reception

The following shows the program for data reception using the bidirectional protocol and program example. For details on the BIDIN instruction, refer to the dedicated instructions. (📖 Page 580 Dedicated Instructions)

Module READY (X1E)

Reception data read request (X3)

BIDIN instruction

BIDIN instruction completion device

BIDIN instruction completion device +1  
(Normal completion/Abnormal completion)

Receive data count (Un\G1536)

Received data (Un\G1537 to 2047)

- ❶ Start the programmable controller of the host station. The setting values specified with an Engineering tool are stored in C24.
- ❷ When data is received from the target device, the 'CH1 reception data read request' (X3) turns ON.
- ❸ After the control data for the BIDIN instruction is stored in the device, the sequence program executes the BIDIN instruction and reads the receive data.
- ❹ When the reading of receive data is completed, a response message (ACK message when the operation was completed normally) is sent and the device that has completed the BIDIN instruction turns ON.

## Program example

| Category            | Label name/FB name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Description                                | Device |            |                       |           |  |       |                       |   |                                          |     |     |            |      |   |                                         |     |     |            |      |   |                                        |     |     |            |      |   |                                |     |     |            |       |   |                 |                                     |     |            |      |   |                            |                                     |     |            |      |   |                |                                     |     |            |      |   |                   |                                     |     |            |      |   |               |                                            |     |            |       |    |                                          |     |     |            |        |    |                  |     |     |            |        |

For information on the module FB to be used, refer to the following manual.

 MELSEC iQ-R Serial Communication Module Function Block Reference

- (0) Specify the reception channel.  
Specify the receive data quantity.  
Set the BIDIN instruction execution direction.
- (54) Abnormal completion
- (56) Reset the abnormal completion flag by an external command.

### Point

- Received data can also be read by using an interrupt programs. ( Page 251 RECEIVING DATA WITH AN INTERRUPT PROGRAM)
- Note that if the reading of data received from the same interface is performed, it is not possible to combine reading data by the main program and that by the interrupt program.  
Use either of the above programs to read the data received.
- The SPBUSY instruction is used to read the execution status when using a dedicated instruction. ( Page 580 Dedicated Instructions)

### Restriction

- More than one BIDIN instruction cannot be executed simultaneously on the same interface.  
Execute the next BIDIN instruction only after the execution of the first BIDIN instruction is completed.
- When the send/receive data quantity is set in byte units and the receive data quantity is an odd byte when requesting the reading of received data to the CPU module, 00H is stored in the higher byte of the last data storage position in the receive area where received data is stored.

## Reception error detection and check methods

The following explains how to detect and confirm errors that may occur when receiving data from target devices.

The following items are considered as the primary causes of errors that may occur during data reception.

| Cause of reception error                                                     | Reference                                                                                         |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| A transmission error occurred due to noise.                                  | MELESEC iQ-R Serial Communication Module User's Manual(Startup)                                   |
| A timeout occurred for the no-reception monitoring time (timer 0).           | Page 260 No-reception Monitoring Time (timer 0) Setting                                           |

### Confirmation using a program

#### ■Detecting a reception error

'CH□ Error occurrence' (XE/XF) turns ON.

#### ■Checking a reception error

Read the 'data reception result' (Un\G600/616), and check it.

For details on how to check the error code contents and corrective actions, refer to the following section.

☞ Page 519 Error Code List

'CH□ Error occurrence' (XE/XF) turns OFF when the data transmission/reception processing is performed normally.

### Confirmation using the module and Engineering tool

#### ■Confirmation using the indicator LED

When C24 detects an error, including a transmission error, the ERR LED turns ON.

#### ■Confirmation using Engineering tool

Monitor the 'data reception result' (Un\G600/616) to check the error code.

### Considerations

- All of the received data for which an error was detected is ignored and a response message indicating an abnormal completion (NAK message) is transmitted to the target device. The 'CH□ reception abnormal detection' (X4/XB) does not turn ON.  
When an error is detected during a message reception, C24 does not request the CPU module to read the received data.
- The receive area in the buffer memory will contain the data received normally just before the error occurrence. (Data will not be rewritten.)

## Receive data clear

Data communications using the bidirectional protocol must be performed after a response message is received in reply to the preceding data transmission.

If C24 detects an error while receiving data, it transmits a NAK message (response message) to the target device after the completion of the data reception and ignores the data being received when the error was detected.

Therefore, the received data does not have to be cleared.

## 4.2 Transmitting Data to Target Device

This section explains the data transmission from the CPU module to a target device.

### Sending methods

The following shows the method of transmitting data to the target device through data communication using the bidirectional protocol.

- 1 Data such as control data and send data are stored in the device designated with the BIDOUT instruction, and then the BIDOUT instruction is executed.
- 2 The send data quantity and send data are written into the send area in the buffer memory.
- 3 C24 transmits data by adding the control code ENQ to the head of the data.
  - When sum check code is enabled in the transmission setting with Engineering tool, C24 adds the sum check code calculated by internal processing to the end of the message and then transmits the message.
  - When sum check code is disabled in the transmission setting with Engineering tool, sum check code is not transmitted.
- 4 A response for the data transmission (for normal completion: ACK message; for abnormal completion: NAK message) is received.
- 5 Once the transmission processing of C24 is completed, the execution of the BIDOUT instruction is completed.

## Send area and send data arrangement

This section explains the send area and the send data arrangement for performing data transmission using the bidirectional protocol.

For details on the contents of send data, refer to the following section.

☞ Page 93 Contents of received data

### Send area

The send area is a memory area for storing the data and the data quantity that are transmitted from the CPU module to a target device via C24.

The send area is assigned to the address, Un\G1024 to 1535 (CH1 side), Un\G2048 to 2559 (CH2 side) by default.

The position and size of the send area in the buffer memory can be changed with Engineering tool in accordance with the specifications of the target device and the send data length. (☞ Page 454 PARAMETER SETTING)

☞ Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

Configure the settings as follows:

- Designate the start address for the area to be used as the send area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) to "Send buffer memory start address designation".
- Designate the length of the area to be used as the send area in the user setting area (Un\G1024 to 6911, Un\G9728 to 16383) by address count (0001H to 1A00H) to "Send buffer memory size specification".

When changing the position and size of the send area in the buffer memory, if any of the functions below are used concurrently, make sure not to overlap with the buffer memory addresses assigned for storing send/receive data handled with the functions.

- MC protocol buffer memory read/write function
- MC protocol on-demand function
- Predefined protocol function (Send/receive data storage area)
- Nonprocedural protocol transmission/receive function
- Bidirectional protocol transmission/receive function
- Send/receive data monitoring function

Set the size of data per data transmission from the target device to C24 to be equal to or smaller than the size of the send data storage area in the buffer memory.

- (Send data storage area) ≥ (Amount of arbitrary data portion to be transmitted from the CPU module)

To transmit data whose size is larger than the send data storage area, increase the send area, or divide the send data before sending.

#### Point

The position and size of send area can be changed in the buffer memory.

- 'Send buffer memory start address designation' (Un\G162/322)
- Send buffer memory size specification (Un\G163/323)

# Send data arrangement

The following example shows an arrangement of the send data to be sent to the target device when storing it in the send area.

Ex.

When transmitting "ABCDEFG123"

# Program for data transmission

## Program example for data transmission

The following shows the program for data transmission and program example.

For details on the BIDOUT instruction, refer to the dedicated instructions. (📖 Page 580 Dedicated Instructions)

- 1 Start the programmable controller on the host station.  
The values specified with Engineering tool are stored in C24.
- 2 Inputs the user data transmission command signal.
- 3 Execute the BIDOUT instruction after storing the send data and the control data for the BIDOUT instruction in the device.  
Data is sent when the BIDOUT instruction is executed.
- 4 A response for the data transmission (for normal completion: ACK message; for abnormal completion: NAK message) is received.
- 5 When the response is received, C24 transmission processing completes and the device that has completed the BIDOUT instruction turns ON.

When the BIDOUT instruction ends abnormally due to the reception of an NAK message, the complete device +1 (abnormal completion signal) turns ON and the error code is stored in the control data completion status (S1+1).

### ■Program example

| Category            | Label name/FB name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Description                           | Device |            |                       |           |  |       |                       |   |                   |     |     |            |       |   |                          |     |     |            |       |   |                        |     |     |            |       |   |                                      |     |     |            |        |   |                                        |     |     |            |        |   |                                         |     |     |            |        |   |                                 |     |     |            |        |   |                      |                                     |     |            |      |   |                        |                                     |     |            |      |    |                    |                     |     |            |       |    |                         |                                     |     |            |        |    |                                       |     |     |            |        |    |                                         |     |     |            |        |

For information on the module FB to be used, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module Function Block Reference

C24

### Point

The SPBUSY instruction is used to read the execution status when using a dedicated instruction. (☞ Page 580 Dedicated Instructions)

### Restriction

More than one BIDOUT instruction cannot be executed simultaneously on the same interface.  
Execute the next BIDOUT instruction only after the execution of the first BIDOUT instruction is completed.

## Transmission error detection and check methods

The following explains how to detect and confirm errors that may occur when transmitting data to target devices.

The following items are considered as the primary causes of errors that may occur during data transmission.

| Cause of transmission error                                                                  | Reference                                                                                                                                          |
|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| A transmission error occurred due to noise.                                                  |  MELSEC iQ-R Serial Communication Module User's Manual(Startup) |
| A timeout occurred for the no-reception monitoring time (timer 0).                           | Page 260 No-reception Monitoring Time (timer 0) Setting                                                                                            |
| A timeout occurred for the response monitoring time (timer 1).                               | Page 263 Response Monitoring Time (timer 1) Setting                                                                                                |
| A timeout occurred for the send monitoring time (timer 2).                                   | Page 265 Send Monitoring Time (timer 2) Setting                                                                                                    |
| Data that could not be converted with the ASCII-BIN conversion was included.                 | Page 391 ASCII-BIN Conversion for Data Communicated with Bidirectional Protocol                                                                    |
| The send data quantity exceeding the size that can be stored in the send area is designated. | Page 100 Send area and send data arrangement                                                                                                       |
| Simultaneous transmissions occurred.                                                         | Page 107 Processing when Simultaneous Transmission is Performed during Full-Duplex Communications                                                  |

### Confirmation using a program

#### ■Detecting a transmission error

The following device and input signal turn ON.

- BIDOUT instruction completion device + 1
- 'CH□ Error occurrence' (XE/XF)

#### ■Checking a transmission error

The transmission error code can be checked using the BIDOUT instruction control data ((S1) + 1).

Or, it can be checked by reading the 'data transmission result' (Un\G599/615).

For details on how to check the error code contents and corrective actions, refer to the following section.

 Page 519 Error Code List

'CH□ Error occurrence' (XE/XF) turns OFF when the data transmission/reception processing is performed normally.

### Confirmation using the module and Engineering tool

#### ■Confirmation using the indicator LED

When C24 detects an error, including a reception error, the ERR LED turns ON.

#### ■Confirmation using Engineering tool

Monitor the 'data transmission result' (Un\G599/615) to check the error code.

## 4.3 Processing when Simultaneous Transmission is Performed during Full-Duplex Communications

This section explains the processing when simultaneous transmission is performed during full-duplex communications.

### Processing when simultaneous transmissions occur

The following explains the processing by C24 when the target device and C24 transmit data at the same time during data communications using the bidirectional protocol.

Note that transmission from a target device and from C24 are not performed simultaneously for data communication by half-duplex communications. (☞ Page 275 DATA COMMUNICATIONS USING HALF-DUPLEX COMMUNICATIONS)

The processing on the C24 side differs depending on the settings with Engineering tool when transmission from a target device and C24 is performed at the same time.

Set "Send data enable/disable" and "Receive data enable/disable" to "Enable" or "Disable" with Engineering tool.

☞ Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings" ⇒ "Various control specification"

The setting value for "Send data enable/disable" and "Receive data enable/disable" is stored in the following area on the buffer memory.

For processing of transmitted/received data on the C24 side for each setting of the 'simultaneous transmitted data valid/invalid designation' (Un\G155/315), refer to the "Processing of transmitted/received data when simultaneous transmission occur".

| Setting contents with Engineering tool                                    | Value stored to buffer memory (Un\G155/315) | C24 processing contents                                                                                                                                                                                                                                                |                                                                                                                                                                      |

(●-m) is the number showing the correspondence with the messages in the figures below.

☞ Page 108 Processing of transmitted/received data when simultaneous transmissions occur

# Processing of transmitted/received data when simultaneous transmissions occur

The following shows the C24 communication data processing based on the settings of 'Send data' and 'Receive data' with Engineering tool by using the examples.

For details on the time check timer 1 (response monitoring time) shown in the figures, refer to the following section.

Page 263 Response Monitoring Time (timer 1) Setting

## Send data: Enable, Receive data: Enable

## Send data: Disable, Receive data: Disable

## Send data: Enable, Receive data: Disable

## Send data: Disable, Receive data: Disable

When the transmission control is performed with "Send data" set to "Enable" and "Receive data" set to "Enable", C24 performs message transmission and message reception processing as described below.

( Page 271 Control Contents of DC Code Control)

During message transmission processing, time check by timer 1 (response monitoring time) is performed.

● Message transmission (①-1 in the figure)

- When C24 receives a transmission terminate request (receiving DC3/DR(DSR) signal OFF) from the target device during message transmission, C24 terminates data transmission.
- When the C24 receives a reception available signal (receiving DC1/DR(DSR) signal ON), C24 restarts data transmission.

● Message reception

- If C24 cannot send a response message to the target device in response to message reception because the target device issued a transmission terminate request (receiving DC3/DR(DSR) signal OFF), C24 transmits the response message after it's in the data transmission available state (receiving DC1/DR(DSR) signal ON).

## 4.4 Considerations for Data Communication

The following describes the considerations for data communications using the bidirectional protocol.

### Factor of C24 transmission sequence initialization

The initial status means the status where transmission has stopped and received data has been discarded.

C24 transmission sequence initialization factors are as follows.

- When the power is turned ON, the CPU module is reset, or the mode is switched.
- When a response message (ACK, NAK, etc.) was received in reply to data transmission.
- When a response message (ACK, NAK, etc.) was transmitted in reply to data reception.

### Data transmission procedure

As a data transmission procedure, data transmission from the target device or C24 should be performed after a response message for the immediately preceding data transmission has been received.

### Units of data length (word/byte) in message to be transmitted/received

Specify the same units of data length (words/bytes) of the messages to be transmitted/received between a target device and the CPU module.

The word/byte units designation can be set with Engineering tool for the CPU module.

Make the length of the data portion in the message to be transmitted and received as long as the size of the send data specification area and the receive data storage area, or less.

### NAK code response

#### ■Response from C24 to target device

After the completion of error detection message reception, it transmits the NAK code to the target device.

#### ■Response from target device to C24

Transmit the error code (0022H to 005FH) immediately after the NAK response.

#### Point

- Perform error processing according to the error code received immediately after the NAK message at the device that received NAK as the response message after data transmission.  
For more details on error codes that are transmitted from C24, refer to the following section.  
(  Page 519 Error Code List)
- If C24 receives an NAK response while transmitting data to a target device, it completes data transmission, then reads the NAK to complete the processing abnormally.
- If C24 detects an error while receiving data, it ignores the received data equivalent to the data length.  
If the data length is abnormal, C24 ignores all the data up to the head data for reception message (ENQ, etc.) received thereafter.

### Target device time-out check

When checking time-out up to reception of the response message at the target device during data transmission from the target device to C24, set the timeout time to the time shown below, or longer.

- (CPU module maximum scan time×2) + 100 ms

## Framing error on the target device side

While nothing is being transmitted from C24 to the target device through the RS-422/485 interface, a framing error may be generated in the target device.

Make the target device skip the data up to transmission of the head data (ENQ, NAK, etc.) of the message from C24.

Before communicating data through the RS-422/485 interface, check the interface specifications on the C24 side.

 MELSEC iQ-R Serial Communication Module User's Manual(Startup)

## Data bit settings

When adding a sum check code to a message, set "Data bit" to "8".

 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ "Module Name" ⇒ [Module Parameter] ⇒ "Basic Settings"  
⇒ "Various control specification"

# 5 DATA COMMUNICATION USING MODBUS

Data can be sent and received between a master and a slave by using a MODBUS data format.

For sending and receiving data in a redundant system, refer to the following section.

☞ Page 624 Using MODBUS in a Redundant System

## 5.1 MODBUS Master Function

C24 communicates with MODBUS slave devices as a master station by using the following function.

| Function                               | Description                                                                                                 | Reference                                            |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------|

| Simple CPU communication function      | Issues a request message for reading/writing to a MODBUS slave device automatically.                        | Page 120 Communication with a MODBUS Slave Device    |

(1) C24

(2) MODBUS slave device

## 5.2 MODBUS Slave Function

C24 supports the MODBUS slave function and can communicate with MODBUS master devices.

(1) MODBUS master device

(2) C24

The following functions are available:

| Function                          | Description                                                                                                                                                                 | Reference                                  |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| Automatic response function       | Automatically performs processing corresponding to the function code in a request message received from a MODBUS master device, and automatically sends a response message. | Page 113 Automatic response function       |
| MODBUS device assignment function | Converts access to MODBUS devices into access to devices of a programmable controller CPU.                                                                                  | Page 114 MODBUS device assignment function |

# Automatic response function

The automatic response function enables C24s to automatically perform corresponding processing according to the function code in a request message received from a MODBUS master device, and automatically send a response message to it. No programs are required for sending response messages on the C24 side.

This function uses the MODBUS device assignment function. For details, refer to the following section.

☞ Page 114 MODBUS device assignment function

## MODBUS device assignment function

The MODBUS device assignment function automatically converts access to MODBUS devices of a slave into access to devices of a CPU module.

MODBUS devices can be associated with device memories of a CPU module with MODBUS device assignment parameters. This enables C24s to convert access to MODBUS devices specified in a request message by MODBUS master devices into access to the corresponding devices of a CPU module and access them.

### Associating MODBUS devices with device memories of a programmable controller CPU

When a request message such as 'write coil' is received from a master, access to MODBUS devices is automatically converted into access to devices of a CPU module.

(1) Request message (request to write 1234H to the holding register 400500)

#### Point

If specifying a device not supported by a CPU module or a device number out of range, an exception code (04) is returned in a response message and 4031H (device specification error) is stored in the detailed error code of 'error log' (Un\G31998 to 32255) in 'MODBUS operating status.'

### Specifying the error status read device

Specify data to be read as an error status by a slave (C24) when the read exception status (FC: 07) is received from a MODBUS master device.

(1) Request message (read exception status (FC: 07))

(2) Response message (exception status 01H)

Values of devices specified in 'error status read device' (Un\G28682 to 28685) are stored in a response message.

## Specifying an access target

Specify an access target when a C24 is connected to a CC-Link IE Field Network remote head module.

A CC-Link IE Field Network remote head module or CC-Link IE Field Network master station can be selected as an access target.

When selecting a master station, the current master station is accessed.

### Precautions

An access target can be specified in a C24 the firmware version of which is '13' or later when the C24 is connected to a CC-Link IE Field Network remote head module. For a C24 the firmware version of which is '12' or earlier, only a CC-Link IE Field Network remote head module can be specified as an access target.

## Specifying a CPU response monitoring timer

Specify the timer so that a C24 will monitor the processing of an access target CPU.

If an error occurs in an access target CPU module and a response message cannot be sent, a response message (error completion) can be sent after the elapse of a specified time.

This can release the state in which a master waits for a response message.

## Setting method

Set MODBUS device assignment in "MODBUS slave setting" of the parameter.

For details, refer to the following section.

 Page 465 MODBUS slave settings

# 5.3 Interlink Function

For using the interlink function in a MODBUS slave, refer to the following chapter.

 Page 429 INDEPENDENT/LINKED OPERATION OF INTERFACE

# 5.4 MODBUS Devices

The following table shows the MODBUS devices supported by a C24.

| MODBUS device type     | Unit | Read/write               | Number of access points          | MODBUS device No.                                                       |
|------------------------|------|--------------------------|----------------------------------|-------------------------------------------------------------------------|
| Coil                   | Bit  | Read/write               | 65536 points                     | 1 to 65536                                                              |
| Input                  | Bit  | Read                     | 65536 points                     | 100001 to 165536                                                        |
| Input register         | Word | Read                     | 65536 points                     | 300001 to 365536                                                        |
| Holding register       | Word | Read/write               | 65536 points                     | 400001 to 465536                                                        |
| Extended file register | Word | Read/write <sup>*1</sup> | 10027008 points <sup>*2,*3</sup> | File number: 0 to 1002 <sup>*2</sup><br>Device number: 600000 to 609999 |

\*1 For the CPU module, read-only memories cannot be set in the file register.

\*2 The maximum values of the number of access points and the file number for the extended file register depend on the size of the file register (ZR) set in the CPU module. ( Page 469 MODBUS extended file register assignment)

\*3 The number of access points for the extended file register is the maximum size that can be set in the CPU module (when the R120CPU + NZ2MC-16MBS are mounted).

# 5.5 Frame Specifications

Frame specifications comply with the specifications of MODBUS protocol.

Frames in RTU mode and ASCII mode can be used.

A frame mode can be selected in "Communication protocol setting" in the module parameter.

For details on the frames, refer to the following manual.

 MELSEC iQ-R MODBUS and MODBUS/TCP Reference Manual

## 5.6 Function List

The following table shows the MODBUS standard functions that can be executed from a MODBUS master device to a C24. The numbers in the following table show the following:

- (1) For broadcast
- (2) For accessing modules other than CC-Link IE Field Network remote head modules
- (3) For accessing CC-Link IE Field Network remote head modules

Executable: ○, Executable (with restrictions): △, Not executable: —

\*1 Accessing MODBUS devices assigned to devices not supported by CC-Link IE Field Network remote head modules results in error completion. (Exception code: 04H)

## MODBUS standard function details

For details on the functions, refer to the following manual.

 MELSEC iQ-R MODBUS and MODBUS/TCP Reference Manual

### ■ Buffer memories used for functions

The following table shows the buffer memories used for each function.

| Application                                                                                                                                                                                                                                                                                             | Buffer memory                                                    | Address Dec (Hex)                           |                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|---------------------------------------------|---------------------------------------------|
|                                                                                                                                                                                                                                                                                                         |                                                                  | CH1                                         | CH2                                         |

# 6 DATA COMMUNICATION IN SIMPLE CPU COMMUNICATION

Data communications between specified devices can be performed at specified timings by configuring simple parameter settings for a C24 in an engineering tool. Data is sent to/received from a specified communication destination on a 1:1 or 1:n (multi-drop connection) basis.

## Restriction

When using the simple CPU communication function, check the firmware versions of a C24. (  Page 686 Added and Changed Functions)

## Communication pattern

Either of the following can be selected.

| Item  | Description                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Read  | To read device data in a specified communication destination (transfer source) to a specified device of the host station (transfer destination).  |
| Write | To write specified device data in the host station (transfer source) to a device of a specified communication destination (transfer destination). |

## Communication setting

Either of the following can be selected.

| Item           | Description                                                        |
|----------------|--------------------------------------------------------------------|
| Fixed Interval | To send and receive device data at a specified execution interval. |
| On Request     | To send and receive device data only on request.                   |

## Communication destination

C24 can communicate with the following devices.

- MELSEC-A series CPU module (  Page 119 Communication with a MELSEC-A Series CPU)
- MODBUS slave device (  Page 120 Communication with a MODBUS Slave Device)

# 6.1 Communication with a MELSEC-A Series CPU

C24 can communicate data with the following MELSEC-A series CPU modules.

| Type  | Model                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| An    | A2CCPU                                                                                                                                                   |
| AnN   | A1NCPUP21, A1NCPUP21-S3, A1NCPUR21<br>A2NCPUP21, A2NCPUP21-S1, A2NCPUP21-S3, A2NCPUP21-S4, A2NCPUR21, A2NCPUR21-S1<br>A3NCPUP21, A3NCPUP21-S3, A3NCPUR21 |
| AnA   | A2ACPUP21, A2ACPUP21-S1, A2ACPUP21-S3, A2ACPUP21-S4, A2ACPUR21, A2ACPUR21-S1<br>A3ACPUP21, A3ACPUP21-S3, A3ACPUR21                                       |
| A0J2H | A0J2HCPUP21, A0J2HCPUR21                                                                                                                                 |
| AnS   | A1SCPUC24-R2                                                                                                                                             |
| AnSH  | A1SHCPU, A1SJHCPU, A2SHCPU                                                                                                                               |
| A2C   | A2CCPUC24, A2CCPUC24-PRF, A2CCPUP21, A2CCPUR21, A2CJCPU-S3                                                                                               |
| AnU   | A2UCPU, A2UCPU-S1, A3UCPU, A4UCPU                                                                                                                        |
| A2US  | A2USCPU, A2USHCPU-S1                                                                                                                                     |

6

## Wiring

For this data communication, use an RS-232 interface of a C24 to connect to a communication destination. Connect an RS-232 interface of a C24 and an RS-422 connector of a MELSEC-A series CPU with an RS-232/RS-422 conversion cable.

For connection, use a gender changer for a D-sub 9 pin between the interface and the cable.

## Precautions

Only a connector of a MELSEC-A series CPU can be connected.

### ■Number of connectable modules

| Channel | RJ71C24 | RJ71C24-R2 | RJ71C24-R4 |
|---------|---------|------------|------------|
| CH1     | 1       | 1          | —          |
| CH2     | —       | 1          | —          |

When using an RJ71C24-R2, both CH1 and CH2 can be connected.

## Considerations for performing simple CPU communication

A bit device is read and written in one bit units and a word device in one word units. This may cause data inconsistency.

## 6.2 Communication with a MODBUS Slave Device

- (1) C24  
(2) MODBUS slave device

C24 can communicate data with the following MODBUS slave devices.

- MODBUS slave (RTU)-compatible device
- MODBUS slave (ASCII)-compatible device

### Wiring

Connect a C24 and a MODBUS slave device.

#### ■Number of connectable modules

| Channel | RJ71C24 | RJ71C24-R2 | RJ71C24-R4 |
|---------|---------|------------|------------|
| CH1     | 1       | 1          | 32         |
| CH2     | 32      | 1          | 32         |

### Considerations for performing simple CPU communication

- Data inconsistency may occur according to the frame specifications of MODBUS protocol.
- For data communication using RS-485 (2-wire type), set "Echo back enable/prohibit specification" to "Echo back prohibit."  
( Page 436 RS-422/485 INTERFACE ECHO BACK ENABLE/PROHIBIT SPECIFICATION)

### List of supported MODBUS standard functions

The following function codes are supported in simple CPU communication.

| Function code (FC)<br>(DEC (HEX)) | Function name            | Supported setting on the simple CPU communication side                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 16 (10H)                          | Write multiple registers | Communication pattern: Write, word device                                                                                                                                                                                                                                                                                                                                                |

\*1 Supported by a C24 with firmware version '21' or later.

#### Point

For a C24 with firmware version '21' or later, specifying the write single register (FC: 06H) in 'Write register specification option for each setting number' (Un\G45160 to Un\G45191) in the buffer memory allows writing registers to communication destinations not supporting the write multiple registers (FC: 10H).  
The function code specified in 'Write register specification option for each setting number' (Un\G45160 to Un\G45191) will be reflected from the next communication after changing the bit value.

## 6.3 Data Communication Procedure

Data communication with a target device can be performed by the following procedure.

1. Set a channel for each communication destination in "Basic Settings" in "Module Parameter."

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71C24] ⇒ [Module Parameter] ⇒ [Basic Settings]

| Item                          |                                | MELSEC-A/AnS (CPU COM)   | MODBUS (RTU)                                       | MODBUS (ASCII)                                                                                                                             |

|                               |                                | Odd/even parity          | Odd (default)                                      | Select according to the communication destination.                                                                                         |
|                               |                                | Stop bit                 | 1 (default)                                        | <ul style="list-style-type: none"> <li>• Parity bit is set to "None": 2</li> <li>• Parity bit is set to "Yes": 1 (default) or 2</li> </ul> |
|                               | Transmission control setting   | Transmission control     | DC code control                                    | DTR/DSR control (default)                                                                                                                  |

Use the default values for the other settings.

2. Set "Simple PLC Communication Setting" in "Module Extended Parameter."

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71C24] ⇒ [Module Extended Parameter] ⇒ [Simple PLC Communication Setting]

For details of the setting, refer to the following section.

Page 478 Simple CPU communication setting

3. Write the settings to the CPU module with an engineering tool after the parameter setting is completed.
4. Reset the CPU module or turn the power OFF and ON, then simple CPU communication starts.

## 6.4 Devices that can be Specified

A bit device and word device can be set at the same time for each setting number.

A bit device can be specified in units of 16 points and a word device in units of 1 point. Specify '0' or a multiple of 16 for the start device number of a bit device.

| Communication destination                                                                                      | Settable device       |                                  |
|----------------------------------------------------------------------------------------------------------------|-----------------------|----------------------------------|

### Point

- The number of points per setting is up to 1024 words (bit: up to 8192 points, word: up to 512 points).
- Set a device of a module within the range specified in the parameter of a CPU module.

## Device range

### ■Host station

The following table lists the maximum numbers of points when an NZ2MC-16MBS is attached to an R120CPU. The number of points varies depending on the type of a CPU module to be used, whether to use an extended SRAM cassette, and its type.

| Type        | Settable device |                 |                                                                                                                                                                                                                                                                                                                                              |

| Word device | D               | 0 to 8191, 9000 to 9255 | For specifying 9000 to 9255 when "Write" is selected for the communication pattern, refer to the manual of a CPU module used.                                                                                                                                              |
|             | W               | 0H to 1FFFFH            | —                                                                                                                                                                                                                                                                          |

### ■Communicating with a MODBUS slave device

Devices that can be used differ depending on a MODBUS slave device. Refer to the manual of each device.

Set the number of points per setting for "Simple PLC Communication setting" in "Parameter" to be up to 1024 words (bit: up to 8192 points, word: up to 512 points).

| Type |                  | Range      | Remarks                                                 |
|------|------------------|------------|---------------------------------------------------------|
| Bit  | Coil             | 0 to 65535 | —                                                       |
|      | Input            | 0 to 65535 | Can be set only when "Communication Pattern" is "Read." |
| Word | Input Register   | 0 to 65535 | Can be set only when "Communication Pattern" is "Read." |
|      | Holding Register | 0 to 65535 | —                                                       |

# 6.5 Operations When Performing Simple CPU Communication

This section explains the operations when performing simple CPU communication.

## Operations when selecting "Fixed Interval" for the communication setting

### Starting communication

Communication starts after a latency time elapses when turning the power OFF and ON or resetting a CPU module. After resetting the CPU module, preparation processing is performed on the system side such as parameter setting check (station numbers and the channel of the host station). If an error occurs in the processing, data is not sent and received.

#### ■Latency time

During a latency time, '1' (preparing) is stored in 'Communication status' for each setting number. When the latency time elapses, 'Preparation completion for each setting number' (Un\G32768 to Un\G32799) turns from OFF to ON.

#### ■If an error occurs in preparation processing

'10' (communications impossible) is stored in 'Communication status' for each setting number, and an error is stored in 'Latest error code' for each setting number.

### Normal operation

Ex.

The following shows a normal operation for setting No.1.

- When sending data to a different communication destination during data communications on the same channel, send data after the data communications being executed are completed.

#### ■Storing an execution interval [ms] (current value)

An execution interval is stored in 'Execution interval [ms] (current value)' for each setting number when an execution interval set in the parameter elapses after the first response is received from a communication destination.

## Operation when an error occurs

If there is no response from a communication destination or an error occurs (error response) after sending data to the communication destination, a retry is performed (data is resent) when a communication time-out period elapses.

The retry is performed for the number of retries set in the parameter plus one.

During a retry, '5' (retry being executed) is stored in 'Communication status' for each setting number.

### Point

- A value in 'Execution interval [ms] (current value)' for each setting number is not updated during a retry.
- '3' (communicating) remains in 'Communication status' for another setting number for which the same communication destination is set.

If an error response is returned even after a retry, it is determined to be in an abnormal state and an error is stored in 'Latest error code' for each setting number.

### Ex.

The following shows an operation when an error occurs in setting No.1 (two retries).

## Operation in an abnormal state

'6' (monitoring at error) is stored in 'Communication status' for each setting number in an abnormal state, and communication is performed during a monitoring time at error (low-speed cycle) set in the parameter.

If a response is received from a communication destination during monitoring at error, the status returns to normal.

(Communication at an execution interval specified in the parameter)

After returning to the normal state, '3' (communicating) is stored in 'Communication status' for each setting number.

### Point

- A value in 'Execution interval [ms] (current value)' for each setting number is not updated in an abnormal state.
- If no response can be received from a communication destination, an error is stored in 'Latest error code' for each setting number.
- When an error response is received from a communication destination, an error is stored in 'Latest error code' for each setting number and the code of an abnormal response is stored in 'Exception code' for each setting number. (An exception code refers to a code returned from a target device (error code and end code).)

## ■Operations when an error occurs for multiple settings

The following shows operations when an error occurs for multiple settings in a C24 with firmware version '21' or later.

If there is no response or an error response (an error occurs) from a communication destination, a communication is performed again at intervals of a monitoring time at error after it is performed for the number of retries plus one. While performing a communication during a monitoring time at error, communications for other setting numbers continue.

The larger the setting values for the communication time-out period and the number of retries, the longer the communications for other setting numbers are interrupted when an error occurs.

**Ex.**

The following shows operations for settings No.1 to 3 when an error occurs in setting No.1 (two retries).

- Setting No.1 (communication setting: fixed interval)

- (1) No response is received from a communication destination.
- (2) Retries are completed.
- (3) Data is sent at intervals of a monitoring time at error during monitoring at error.
- (4) A response is received from the communication destination.
- (5) When the response is received from the communication destination, data is sent at execution intervals set in the parameter.

- Setting No.2 (communication setting: fixed interval)

- (6) An execution interval set in the parameter elapses.
- (7) Data in setting No.2 is sent after the retry for setting No.1 is completed.

- Setting No.3 (communication setting: on request)

- (8) Data in setting No.3 is sent after the reception of the response for setting No.2 is completed.

Request to start communication at request is turned ON after (6) for setting No.2 (communication setting: fixed interval).

## Precautions

For a C24 with firmware version '20' or earlier, an operation when an error occurs for multiple settings is as follows:

- If there is no response or an error response (an error occurs) from a communication destination, a communication for the same setting number is repeated until it is established normally. To continue communications for other setting numbers, turn ON 'Request to stop communication for each setting number' (Un\G32672 to Un\G32703) for the setting number for which an error occurs and stop the communication.

When an error occurs, take appropriate actions based on the firmware version of a module used.

## Request to stop and restart communication

When selecting "Fixed Interval" for the communication setting, communication can be stopped and restarted.

### ■Stopping communication

To stop communication, turn 'Request to stop communication for each setting number' (Un\G32672 to Un\G32703) from OFF to ON when '3' (communicating), '5' (retry being executed), or '6' (monitoring at error) is stored in 'Communication status' for each setting number.

The communication stops at a communication timing of the next execution interval.

If there is no response from a communication destination while a stop request is accepted, communication stops after a communication time-out period elapses. During a retry, communication stops after the communication time-out period elapses regardless of the number of retries.

### ■Restarting communication

To restart communication, turn 'Request to restart communication for each setting number' (Un\G32704 to Un\G32735) from OFF to ON when '4' (communication stop) is stored in 'Communication status' for each setting number.

After the communication restarts, 'Request to restart communication for each setting number' (Un\G32704 to Un\G32735) turns from ON to OFF.

#### Ex.

The following shows an operation when stopping and restarting communication for setting No.1.

### Point

Values in 'Latest error code' and 'Exception code' are not cleared even if a request to stop or restart communication is sent. To clear them, turn the buffer memory 'Error clear request' from OFF to ON in a program and others.

## ■Operation when restarting communication

An operation after restarting communication differs depending on a value in 'Communication status' before stopping the communication.

| Communication status before stopping communication                                            | Operation after restarting communication                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Communicating</li> <li>Retry being executed</li> </ul> | <p>A fixed cycle communication is performed at an execution interval set in the parameter.</p> <p>The communication restarts at the next execution interval after turning 'Request to restart communication for each setting number' (Un\G32704 to Un\G32735) from OFF to ON.</p> <p>When restarting the communication, each buffer memory will be in the following states:</p> <ul style="list-style-type: none"> <li>'Execution status flag for each setting number' (Un\G32736 to Un\G32767): ON</li> <li>'Communication status' for each setting number: 3 (communicating)</li> <li>'Execution interval [ms] (current value)' for each setting number: An execution interval is stored.</li> </ul> |
| Monitoring at error                                                                           | <p>A fixed cycle communication is performed during a monitoring time at error.</p> <p>When restarting the communication, each buffer memory will be in the following states:</p> <ul style="list-style-type: none"> <li>'Execution status flag for each setting number' (Un\G32736 to Un\G32767): ON</li> <li>'Communication status' for each setting number: 6 (monitoring at error)</li> </ul>                                                                                                                                                                                                                                                                                                       |

## Precautions

- If a value other than '3' (communicating), '5' (retry being executed), or '6' (monitoring at error) is stored in 'Communication status' for each setting number, a request is ignored even when turning 'Request to stop communication for each setting number' (Un\G32672 to Un\G32703) from OFF to ON. In this case, turn it from ON to OFF.
- If a value other than '4' (communication stop) is stored in 'Communication status' for each setting number, a request is ignored even when turning 'Request to restart communication for each setting number' (Un\G32704 to Un\G32735) from OFF to ON. In this case, turn it from ON to OFF.
- If the communication setting is not set or "On Request" is selected, a request is ignored even when turning 'Request to restart communication for each setting number' (Un\G32704 to Un\G32735) or 'Request to stop communication for each setting number' (Un\G32672 to Un\G32703) from OFF to ON. Therefore, they are not turned from ON to OFF by the system and remain ON.

# Operations when selecting "On Request" for the communication setting

## Starting communication

Communication starts by turning 'Request to start communication at request for each setting number' (Un\G32640 to Un\G32671) from OFF to ON when a latency time elapses after turning the power OFF and ON or resetting a CPU module.

### Point

After resetting the CPU module, preparation processing is performed on the system side such as parameter setting check (station numbers and the channel of the host station). If an error occurs in the processing, data is not sent and received.

### Latency time

During a latency time, '1' (preparing) is stored in 'Communication status' for each setting number. When the latency time elapses, 'Preparation completion for each setting number' (Un\G32768 to Un\G32799) turns from OFF to ON.

### If an error occurs in preparation processing

'10' (communications impossible) is stored in 'Communication status' for each setting number, and an error is stored in 'Latest error code' for each setting number.

## Normal operation

### Ex.

The following shows a normal operation for setting No.1.

During a latency time, a request is ignored even when turning 'Request to start communication at request for each setting number' (Un\G32640 to Un\G32671) from OFF to ON. When turning it from ON to OFF after data is sent or received, '2' (waiting for the request) is stored in 'Communication status' for each setting number and a single communication is completed.

- When 'Request to start communication at request for each setting number' (Un\G32640 to Un\G32671) turns from OFF to ON during preparation processing or a latency time on the system side, communication starts when 'Preparation completion for each setting number' turns ON and '2' (waiting for the request) is stored in 'Communication status' for each setting number.
- After it is detected that 'Request to start communication at request for each setting number' (Un\G32640 to Un\G32671) has turned from OFF to ON, a request is ignored before 'Execution status flag for each setting number' (Un\G32736 to Un\G32767) turns OFF (communication stop) even when turning 'Request to start communication at request for each setting number' (Un\G32640 to Un\G32671) from ON to OFF and ON again in a program and others. (No error occurs.)

## Operation when an error occurs

If there is no response from a communication destination or an error occurs (error response) after sending data to the communication destination, a retry is performed (data is resent) when a communication time-out period elapses.

The retry is performed for the number of retries set in the parameter plus one.

During a retry, '5' (retry being executed) is stored in 'Communication status' for each setting number.

If an error response is returned even after a retry, it is determined to be in an abnormal state and an error is stored in 'Latest error code' for each setting number.

**Ex.**

The following shows an operation when an error occurs in setting No.1 (two retries).

## ■Operation in an abnormal state

In an abnormal state, 'Execution status flag for each setting number' (Un\G32736 to Un\G32767) turns OFF (communication stop). Therefore, when turning 'Request to start communication at request for each setting number' (Un\G32640 to Un\G32671) from ON to OFF in a program and others, '2' (waiting for the request) is stored in 'Communication status' for each setting number.

### Point

- In an abnormal state, '2' (waiting for the request) remains in 'Communication status' for another setting number for which the same communication destination is set.
- If no response can be received from a communication destination, an error is stored in 'Latest error code' for each setting number.
- When an error response is received from a communication destination, an error is stored in 'Latest error code' for each setting number and the code of an abnormal response is stored in 'Exception code' for each setting number. (An exception code refers to a code returned from a target device (error code and end code).)

# Broadcast operation

When "Station No." is set to '0' in the "Communication Destination Setting" screen (in the "Simple PLC Communication Setting" screen of "Module Extended Parameter"), broadcast to MODBUS slave devices can be performed. (  Page 481 Host station channel number, station number)

When broadcasting to MODBUS slave devices, the communication time-out period set in the parameter operates as the broadcast delay.  
After sending data, a normal completion is established by timeout for the broadcast delay (communication time-out period), and the processing is repeated.

Point

Broadcast is sent to all slave stations; therefore, consider each processing time of all slave devices and set the sufficient time for communication time-out period (broadcast delay).  
If there is a slave device the communication time-out period of which is set insufficiently, an error may occur for another request to the slave device.

## Normal operation

**Ex.**  
The following shows a normal operation for setting No.1.

■ **Storing an execution interval [ms] (current value)**  
An execution interval is stored in 'Execution interval [ms] (current value)' for each setting number after normal completion.

## 6.6 Checking Simple CPU Communication Status

The status of simple CPU communication can be checked in the buffer memory.

### Point

Values in the buffer memory are all cleared when switching a CPU module from STOP to RUN after changing module extended parameters and writing them to the CPU module.

| Item                                                              | Address                | Description                                                                                                                                |

| Write register specification option for each setting number |                                        | Un\G45160 to Un\G45191                  | For 512 settings (1 bit per setting)<br>A function code used when the number of written word points is one in communication with a MODBUS slave device<br>• OFF: Write multiple registers (FC: 10H)<br>• ON: Write single register (FC: 06H) |                                                                                                                                                                                                                   |

<sup>\*1</sup> Enabled when the corresponding setting number in 'Setting status of each setting number' (Un\G32832 to Un\G32863) is ON.

<sup>\*2</sup> Stored only when selecting "On Request" for the communication setting.

<sup>\*3</sup> Stored only when selecting "Fixed Interval" for the communication setting.

<sup>\*4</sup> A selectable CPU number differs depending on the communication destination.

<sup>\*5</sup> When the maximum value is exceeded, counting continues from 1.

<sup>\*6</sup> When 'Error clear request' (Un\G32865) turns ON, values stored in 'Latest error code' (Un\G32892) and 'Exception code' (Un\G32893) are cleared. Then, 'Error clear request' (Un\G32865) turns OFF.

## Exception codes

The following table lists the exception codes returned from a communication destination when communication fails.

### Communicating with a MELSEC-A/AnS (CPU COM)

| Exception code | Item                       | Description                                                  | Corrective action                                                                                                                                                                                       |
|----------------|----------------------------|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1H             | Busy                       | Processing failed because the CPU module was busy.           | <ul style="list-style-type: none"><li>Restart data communications.</li><li>Increase the execution interval.</li><li>If an error occurs in a MELSEC-A series CPU, take the corrective actions.</li></ul> |
| 4H             | Cancellation of processing | New processing was requested during processing.              | <ul style="list-style-type: none"><li>Increase the communication time-out period.</li><li>If an error occurs in a MELSEC-A series CPU, take the corrective actions.</li></ul>                           |
| 5H             | Sum check error            | The received sum value and the calculated one did not match. | <ul style="list-style-type: none"><li>Review the cable connection and wiring.</li><li>Take measures against noise.</li></ul>                                                                            |
| 6H             | Busy                       | Processing failed because the CPU module was busy.           | <ul style="list-style-type: none"><li>Restart data communications.</li><li>Increase the execution interval.</li><li>If an error occurs in a MELSEC-A series CPU, take the corrective actions.</li></ul> |
| 1BH            | Busy                       | Processing failed because the CPU module was busy.           | <ul style="list-style-type: none"><li>Restart data communications.</li><li>Increase the execution interval.</li><li>If an error occurs in a MELSEC-A series CPU, take the corrective actions.</li></ul> |

### Communicating with a MODBUS slave device

For exception codes from a MODBUS slave device, refer to the following section.

 Page 543 MODBUS Exception Code List

# 6.7 Communication Example

This section shows an example of transferring B0 to B1FFF and W0 to W1FF of the host station to M0 to M8191 and D0 to D511 of a communication destination respectively by using the simple CPU communication function.

## System configuration

## Device assignment

The following shows assignment of devices sent and received in simple CPU communication.

## Parameter setting

The following shows the procedure for connecting an engineering tool to a CPU module and setting parameters.

### ■Setting for the host station (transfer source)

#### Operating procedure

1. Set the CPU module as follows:

 [Project] ⇒ [New]

2. Click the [Setting Change] button to set to use module labels.
3. Click the [OK] button to add module labels of the CPU module.

4. Set the RJ71C24 as follows:

 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ right-click ⇒ [Add New Module]

5. Click the [OK] button to add module labels of the RJ71C24.

## 6. Set the items in "Basic Settings" as follows:

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71C24] ⇒ [Module Parameter] ⇒ [Basic Settings] ⇒ [Various control specification] ⇒ [Communication protocol setting]

## 7. Set the items in "Module Extended Parameter" as follows:

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71C24] ⇒ [Module Extended Parameter] ⇒ [Simple PLC Communication Setting]

A setting screen appears by double-clicking any one of the following in the "Simple PLC Communication Setting" screen.

- "Latency Time"
- "Simple PLC Communication Setting No.1" to "Simple PLC Communication Setting No.512"

## 8. Set the items in "Simple PLC Communication Setting" as follows:

| Setting No. | Communication Pattern | Communication Setting: Execution Interval(ms) | Communication Destination (Host Station Channel No.) |                        | Target PLC No. |
|-------------|-----------------------|-----------------------------------------------|------------------------------------------------------|------------------------|----------------|
|             |                       |                                               | Source                                               | Destination            |                |
| 1           | Write                 | On Request                                    | Host Station                                         | MELSEC-A/AnS(CPU)(CH1) | Not Specified  |
| 2           | Read                  | On Request                                    | Host Station                                         | MELSEC-A/AnS(CPU)(CH1) | Not Specified  |

| Target PLC No. | Points | Bit Device |       |       |             | → | Word Device |       |     |             | →     | Communication Time-out Period(ms) | Communication Retry Count | Monitoring Time At Error(s) | Comment |     |      |   |  |
|----------------|--------|------------|-------|-------|-------------|---|-------------|-------|-----|-------------|-------|-----------------------------------|---------------------------|-----------------------------|---------|-----|------|---|--|
|                |        | Type       | Start | End   | Destination |   | Type        | Start | End | Destination |       |                                   |                           |                             |         |     |      |   |  |
| Not Specified  | 0192   | B          | 00000 | 01FFF | →           | M | 0           | 0191  | 512 | W           | 00000 | 001FF                             | →                         | D                           | 0       | 511 | 5000 | 3 |  |

## 9. Write the set parameters to the CPU module, and reset the CPU module or turn the power OFF and ON.

[Online] ⇒ [Write to PLC]

### Point

The default settings are used for parameters other than the above in a program example. For the parameters, refer to the following chapter. (Page 455 Module Parameters)

## Program examples

The following shows examples of programs written to a transfer source CPU module.

### ■Communication on request

The following shows an example of storing ABCDH and 5555H in a bit device and word device respectively and transferring them, when selecting "On Request" for the communication setting.

| Category     | Label name                               | Description                                                                        | Device      |
|--------------|------------------------------------------|------------------------------------------------------------------------------------|-------------|
| Module label | C24_1.bnSts_Start_Request_SimplePLC_D[1] | Request to start communication at request of simple CPU communication setting No.1 | Un\G32640.0 |
|              | C24_1.bnSts_Status_Flag_SimplePLC_D[1]   | Execution flag of simple CPU communication setting No.1                            | Un\G32736.0 |
|              | C24_1.bnReady_SimplePLC_D[1]             | Preparation completion flag of simple CPU communication setting No.1               | Un\G32768.0 |
|              | C24_1.stnSimplePLC_Diag[1].wStatus_D     | Communication status storage location of simple CPU communication setting No.1     | Un\G32876   |
|              | C24_1.stnSimplePLC_Diag[1].uErrorCode_D  | Error code storage location of simple CPU communication setting No.1               | Un\G32892   |

Label to be defined

|   | Label Name    | Data Type                           |     | Class      | Assign (Device/Label) |
|---|---------------|-------------------------------------|-----|------------|-----------------------|
| 1 | bStartRequest | Bit                                 | ... | VAR_GLOBAL | M0                    |

## ■ Stopping and restarting communication

The following shows an example of stopping and restarting communication, when selecting "Fixed Interval" for the communication setting.

| Category            | Label name                                                                                                                                                                                                                                                                                                                     | Description                                                                    | Device      |            |                       |       |                       |   |              |     |     |            |      |   |                 |     |     |            |      |  |  |

## 6.8 Considerations

This section shows the considerations for using this data communication.

### Setting an execution interval

The execution interval of the simple CPU communication function and the time to complete communication vary depending on the load rate of the line, scan time of a communication destination, and system configuration; therefore, a set interval and time may be extended.

#### ■ Causes of a long execution interval of the simple CPU communication function

- The scan time of the control CPU module of a C24 with the simple CPU communication function set is long.
- The load on the line is high.
- There are many settings in "Simple PLC Communication Setting."
- A response from a communication destination is slow.
- Multiple C24s with the simple CPU communication function set are mounted on a base unit (main base unit and extension base unit).
- A response is slow or there is no response from a communication destination for other setting numbers.

Set a sufficient execution interval to perform communication at the set execution interval. Check an execution interval in the buffer memory by actually performing communication if necessary.

### Devices of a communication destination

Check the types and ranges of read/write devices of a communication destination.

When selecting "Write" for "Communication Pattern," control data of a communication destination may be rewritten, which may cause a malfunction.

### Security

If a remote password is set for a communication destination, simple CPU communication cannot be performed.

Remove the remote password.

### Using devices of the host station

When using devices of the host station, be sure to assign devices within the setting range.

Otherwise, data in another device is read or written.

### Corrective action if an error occurs during communication

If an error occurs during communication, data may not be written normally.

Check the error and take a corrective action, then perform the communication again.

### Data inconsistency

Data in a setting is divided to send and receive depending on the communication destination.

This may cause data inconsistency.

### Clearing an error

A value in 'Latest error code' for each setting number is not cleared even after the communication status returns to normal.

To clear an error, turn 'Error clear request' (Un\G32865) from OFF to ON.

## Writing data to the buffer memory

Do not write data to 'RS and DTR signal status designation' when performing simple CPU communication. Otherwise, communication may fail and an error such as a timeout may occur.

## Reconnection

When disconnecting and reconnecting the cable, note the following:

- If "Fixed Interval" is selected for the communication setting, connect the cable when '4' (communication stop) or '6' (monitoring at error) is stored in 'Communication status' for each setting number.
- If "On Request" is selected for the communication setting, connect the cable when '2' (waiting for the request) is stored in 'Communication status' for each setting number.

# 7 DEBUG SUPPORT FUNCTION

The debug support function is designed to support the debugging of communication processing between C24 and target device. The following functions are available to ease system startup work.

- Circuit trace
- Protocol execution log storage function (for predefined protocol only)

## 7.1 Circuit Trace

The communication data and communication control signal between C24 and target device are traced.

### Procedure for the circuit trace

The following shows the procedure for the circuit trace.

#### Operating procedure

1. Start circuit trace from Engineering tool.
2. Perform communications with the target device.
3. Stop circuit trace in Engineering tool.
4. Circuit trace results are displayed.
5. Confirm the send/receive packet data and communication control signal.

## Performing circuit trace

The trace data is stored in the monitor buffer to trace the communication data and communication control signal status.

### Operating procedure

1. Select [Tool] ⇒ [Circuit Trace] in Engineering tool.
2. Click the [Module Selection] button to select the module to be traced in the "Module Selection (Circuit Trace)" screen.

3. Select the channel to be traced from "Channel Selection", and click the [Start Trace] button.

4. When the monitor buffer is full, or the [Stop Trace] button is clicked, the trace data are displayed.
5. Confirm the send/receive packets and communication control signals from the displayed trace result.

## Circuit trace option setting

In the circuit trace option setting, the following two items can be set.

- Setting a start address and size of buffer area of C24 in which circuit trace data is stored (hereinafter, 'monitor buffer area')
- Setting whether the circuit trace is stopped or continued when the timer 0 error occurs

## Operating procedure

1. Select [Tool] ⇒ [Circuit Trace] in Engineering tool.
2. Click the [Options] button.

3. On the "Circuit Trace Option" screen, set "Start Address", "Size", and "Stop Setting" of the buffer memory of C24, and click the [OK] button.

**Circuit Trace Option**

**Circuit Trace Data Storage Area Setting**

Start Address: 2600 (HEX)

Size: 0D00 (HEX)

**Stop Setting**

☐ Stop by occurrence of timer 0 time-out error

**Explanation**

Set the start buffer memory address to store the circuit trace data.  
 Range: 0x0C00 to 0x1AFD  
 0x2600 to 0x3FFD  
 Set one of the two areas.  
 These areas cannot be overlapped.

OK Cancel

Note that the range of this value is checked at start of the circuit trace when using the user setting area. |
| Stop Setting                            | Stop by occurrence of timer 0 timeout error | Set whether or not the circuit trace is stopped when the timer 0 timeout error occurs.                                                                                                                                                                                                                                                                                                                                                        |

\*1 The maximum address for the trace data storage area is calculated by the following formula.  
 Maximum address for the trace data storage area = "Start Address" + "Size" – 1

## 7.2 Protocol Execution Log Storage Function (for Predefined Protocol only)

This function checks the detailed predefined protocol execution status and results for each channel. Up to 32 protocol execution logs can be checked.

If the number of the stored logs exceeds 32, the oldest log will be overwritten.

The protocol execution log can be checked in the following method.

- Checking with Engineering tool
- Checking with the buffer memory

### Precautions

Do not perform the above two methods at the same time.

The latest execution logs are not stored in the buffer memory while they are being updated with the predefined protocol support function of Engineering tool.

# Checking with Engineering tool

Check the protocol execution logs and protocol execution results in the "Protocol Execution Log" screen of Engineering tool.

## Operating procedure

1. Select a module to be debugged.
  - Display the "Protocol Setting" screen. (☞ Page 31 Data Communication Procedure)
  - Select "Protocol Setting" ⇒ [Debugging Support Function] ⇒ [Module Selection].
  - Select the I/O address and channel of the module to be debugged, and click the [Set] button.
  - As the [OK] button is clicked, the module information is set.

| I/O Address | Type    |
|-------------|---------|
| 00          | RJ71C24 |

2. Execute the CPRTCL instruction.
3. Select "Protocol Setting" ⇒ [Debugging Support Function] ⇒ [Protocol Execution Log].

7

## Window

| No. | Start Time and Date | End Date            | Model          | Protocol No. | Protocol Name   | Type         | Execution Result  | Error Code | Retry | Packet No. |
|-----|---------------------|---------------------|----------------|--------------|-----------------|--------------|-------------------|------------|-------|------------|
| 1   | 2014-09-02 17:56:05 | 2014-09-02 17:56:05 | FREQROL Series | 1            | H7B-RD Operator | Send/Receive | Normal completion |            | 0     | 1          |

### Point

The logs displayed in the "Protocol Execution Log" screen can be selected from the following two items, according to the log registration condition.

- Displaying only protocol that completed abnormally.
- Displaying all protocol execution status and execution logs.

The log registration condition can be set in "Execution log options" in the "Various control specification" screen of Engineering tool.

# Checking with the buffer memory

Check the protocol execution logs in the execution log storage area.

## Operating procedure

- 1. The log registration condition can be set by the 'Execution log options' in the buffer memory (Un\G16610/16626) .

- 2. Execute the CPRTCL instruction.
- 3. Check the protocol execution logs stored in the execution log storage area (Un\G16643 to 18177/18435 to 19969). For details, refer to the following section.

Page 550 Buffer memory list

# PART 2

# ADDITIONAL FUNCTIONS

This part explains the additional functions of C24.

8 USING THE PROGRAMMABLE CONTROLLER CPU MONITORING FUNCTION

9 COMMUNICATIONS BY THE MODEM FUNCTION

10 RECEIVING DATA WITH AN INTERRUPT PROGRAM

11 CHANGING DATA LENGTH UNITS TO BYTE UNITS (WORD/BYTE UNITS SETTING)

12 CHANGING DATA COMMUNICATION MONITORING TIME

13 DATA COMMUNICATIONS USING DC CODE TRANSMISSION CONTROL

14 DATA COMMUNICATIONS USING HALF-DUPLEX COMMUNICATIONS

15 CONTENTS AND REGISTRATION OF USER FRAMES FOR DATA COMMUNICATION

16 ON-DEMAND DATA COMMUNICATIONS USING USER FRAMES

17 DATA COMMUNICATIONS USING USER FRAMES

18 TRANSPARENT CODES AND ADDITIONAL CODES

19 COMMUNICATING WITH ASCII CODE (ASCII-BIN CONVERSION)

20 DATA COMMUNICATIONS BETWEEN TARGET DEVICE AND CPU MODULE IN M:N BASIS

21 SWITCHING THE MODE AFTER STARTING

22 USING SEND/RECEIVE DATA MONITORING FUNCTION

23 INDEPENDENT/LINKED OPERATION OF INTERFACE

24 PARAMETER REGISTRATION TO CPU MODULE

25 RS-422/485 INTERFACE ECHO BACK ENABLE/PROHIBIT SPECIFICATION

26 ERRONEOUS NOISE SIGNAL RECEPTION PREVENTION FUNCTION

# 8 USING THE PROGRAMMABLE CONTROLLER CPU MONITORING FUNCTION

This chapter explains the programmable controller CPU monitoring function with which the C24 monitors the programmable controller CPU based on the monitoring information reregistered by the user.

## 8.1 Overview

This section explains an overview of the programmable controller CPU monitoring function.

### Transmitting data without a program

- The programmable controller CPU monitoring function enables C24 to monitor the CPU module on the host station at time intervals set by the user by reregistering data to be used for the programmable controller CPU monitoring function. Data transmission to the target device communicating with the MC or nonprocedural protocol is possible without a program.
- The following monitoring information selected by the user can be sent to the target device as the CPU module monitoring results.

| Transmission method | Monitoring result                                                                  |                                       | Without the modem function | Combined use of the modem function (modem communication) |
|---------------------|------------------------------------------------------------------------------------|---------------------------------------|----------------------------|----------------------------------------------------------|
| Data transmission   | Devices on the host station CPU module (information of the device to be monitored) | Numeric value stored in a word device | ○                          | ○                                                        |
|                     |                                                                                    | ON/OFF status of a bit device         |                            |                                                          |
|                     | Status of module of the host station CPU module                                    |                                       |                            |                                                          |

- There are two timings for transmitting the programmable controller CPU monitoring results to the target device; fixed cycle send and condition match send.

The fixed cycle send transmits the programmable controller CPU monitoring results each time when CPU module is monitored.

The condition match send transmits when the information read from the CPU module satisfies the defined conditions and when an error is detected in the CPU module.

### Simplifying device monitoring procedure

When device monitoring is performed by communication using the MC protocol, the target device must repeatedly perform monitor request transmission and monitor data reception processing after it executes monitor registration.

By designating the fixed cycle send for the programmable controller CPU monitoring function, the device data can be monitored without performing the monitor request reception processing.

### Notifying programmable controller CPU error

In the condition match send, error information can be transmitted to the target device whenever CPU module error occurs without any programming.

## 8.2 Programmable Controller CPU Monitoring Function

This section explains the programmable controller CPU monitoring function.

### Data registration for using the programmable controller CPU monitoring function

The following explains the data registration by the user to use the programmable controller CPU monitoring function.

#### Registration procedure for the Programmable Controller CPU monitoring function

Programmable controller CPU monitor registration for C24 that is required to use the programmable controller CPU monitoring function is described in the following sections. The registration can be performed using one of the following methods:

- Registration with an Engineering tool
- Registration using the programmable controller CPU monitoring registration command (0630) for communication with the MC protocol ( MELSEC Communication Protocol Reference Manual)
- Registration using the "CSET" instruction for the CPU module ( MELSEC iQ-R Programming Manual (Module Dedicated Instructions))

#### Combination with modem function

Before transmitting the CPU module monitoring result when used in conjunction with the modem function, register the data for connection of the modem function.

 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ Module Name ⇒ [Module Parameter] ⇒ "Application Settings" ⇒ "Modem function setting"

#### Starting programmable controller CPU monitoring function

By registering the data for using the programmable controller CPU monitoring function, C24 begins monitoring the programmable controller CPU.

# CPU module monitoring information

The following explains the monitoring target information used to perform the programmable controller CPU monitoring function.

## Target of programmable controller CPU monitoring function

The following information can be registered as the target of the programmable controller CPU monitoring function.

- Device monitoring for the host station CPU module
  - Monitoring of the numeric values stored in the word device
  - Monitoring of bit devices ON/OFF status
- Monitoring status of the host station CPU module

## Registering word devices and bit devices

For monitoring word and bit devices, up to 960 device points (up to 15360 bits for only bit devices) in total, which is equivalent to 10 blocks in total when any continuous device range comprised one block, can be registered.

Since monitoring of the CPU module status on the host station will be also registered as one block, up to 11 blocks can be registered.

- $11 \geq (\text{Number of registered word device blocks} + \text{Number of registered bit device blocks}) + \text{CPU status monitoring (1 block)}$
- $960 \text{ points} \geq (\text{Total number of all word device block points (1 point = 1 word)} + \text{Total number of all bit device block points (1 point = 16 bits)})$

### Point

To register the device memory to monitor, designate the word device blocks for the registered word blocks, then designate the bit device blocks for the registered bit blocks.

8

## Example for registering word devices and bit devices

The start device of each block is the monitoring target for device monitoring of the blocks for which the word and bit devices are registered.

### Ex.

For a block in which 10 points of word devices from D100 to D109 are registered

Monitoring target: Numeric value to be stored in D100

Data transmission: Numeric values to be stored in D100 to D109

### Ex.

For a block in which two points of bit devices from M100 to M131 are registered

Monitoring target: ON/OFF status of M100

Data transmission: ON/OFF status of M100 to M131

## List of device code

The word and bit devices that can be designated as the monitoring targets and the device codes that are used to register the monitoring devices are listed in the table below.

Register the devices using the device ranges existing in the CPU module.

| Category        | Device                | Device type   |      | Device code |        | Device range (Default) |
|-----------------|-----------------------|---------------|------|-------------|--------|------------------------|
|                 |                       | Bit           | Word | ASCII       | Binary |                        |
| Internal system | Special relay         | ○             | —    | SM          | 91H    | 0 to 4096              |
|                 | Special register      | —             | ○    | SD          | A9H    |                        |
| Internal user   | Input                 | ○             | —    | X*          | 9CH    | 0 to 2FFFFH            |
|                 | Output                | ○             | —    | Y*          | 9DH    |                        |
|                 | Internal relay        | ○             | —    | M*          | 90H    | 0 to 12287             |
|                 | Latch relay           | ○             | —    | L*          | 92H    | 0 to 8191              |
|                 | Annunciator           | ○             | —    | F*          | 93H    | 0 to 2047              |
|                 | Edge relay            | ○             | —    | V*          | 94H    |                        |
|                 | Link relay            | ○             | —    | B*          | A0H    | 0 to 1FFFFH            |
|                 | Data register         | —             | ○    | D*          | A8H    | 0 to 18431             |
|                 | Link register         | —             | ○    | W*          | B4H    | 0 to 1FFH              |
|                 | Timer                 | Contact       | ○    | —           | TS     | 0 to 1023              |
|                 |                       | Coil          | ○    | —           | TC     |                        |
|                 |                       | Current value | —    | ○           | TN     |                        |
|                 | Retentive timer       | Contact       | ○    | —           | SS     | 0                      |
|                 |                       | Coil          | ○    | —           | SC     |                        |
|                 |                       | Current value | —    | ○           | SN     |                        |
|                 | Counter               | Contact       | ○    | —           | CS     | 0 to 511               |
|                 |                       | Coil          | ○    | —           | CC     |                        |
|                 |                       | Current value | —    | ○           | CN     |                        |
|                 | Link special relay    | ○             | —    | SB          | A1H    | 0 to 7FFH              |
|                 | Link special register | —             | ○    | SW          | B5H    |                        |
|                 | Direct input          | ○             | —    | DX          | A2H    | 0 to 2FFFFH            |
|                 | Direct output         | ○             | —    | DY          | A3H    |                        |
|                 | Index register        | —             | ○    | Z*          | CCH    | 0 to 20                |
| Register        | File register         | —             | ○    | R*          | AFH    | 0 to 32767             |
|                 |                       | —             | ○    | ZR          | B0H    | —                      |

### Point

- Designating a non-existent device code will result in an error.
- When the device range in the parameter setting has been changed, the new device range can be set as the programmable controller CPU monitoring target.

# Monitoring timing of CPU module

The following explains the timing for programmable controller CPU monitoring when the programmable controller CPU monitoring function is performed.

To monitor the CPU module, C24 reads the monitoring information (device information and CPU module status information) from the CPU module at the set interval.

## Cycle time

1 to 65535 (unit: 100 ms/s/min) can be registered.

Use the following formula as a reference when registering the cycle time.

### ■When transmitting device data or the programmable controller CPU status

- Cycle time designation > K + SST + PT + DTT

### ■When transmitting data in conjunction with the modem function

- Cycle time designation > K + SST + PT + DTT + DTTm + MCDT + CDWT
- When modem initialization has not been performed, the modem initialization time will be added. (Performing modem initialization in advance is recommended.)

The items in the formula above is as follows:

- K: 60 ms constant (C24 internal processing time)
- SST (Sequence scan time): Time required for one scan
- PT (Processing time): Processing time for the "Multiple block batch read word unit command 0406"
- For 1 point : 10.2 ms
- For 480 points: 21.1 ms
- For 960 points: 32.6 ms
- DTT (data transmission time) = 1 ÷ Transmission rate × Number of bit for one byte during transmission × Number of byte for send data
- Number of bit for one byte portion during transmission = 1 + Data bit count + Parity bit + Stop bit count (parity bit: Yes = 1, None = 0)
- DTTm (Data transmission delay time by the modem): Depends on the modem specification, line specification, and line status.
- MCDT (modem connection and disconnection time): Depends on the modem specifications, line specifications, and line status.
- CDWT (Line disconnection wait time): Wait time for disconnecting line
- Modem initialization time: Depends on the modem specifications.

### Point

Since C24 reads the monitoring information (device data, programmable controller CPU status) at the time of the next END process of the CPU module after the cycle time elapses, make the cycle time as long as possible.

The following phenomenon may be occurred if the cycle time is short.

- The number of scan of which CPU module scan time gets longer will be increased.
- The processing time for other data communication functions will be increased due to the increase of the C24 programmable controller CPU monitoring function processing time.
- The load on the target device will be increased.

## Timings of transmitting monitoring results to the target device

The following explains the timings for the transmission of CPU module monitoring results.

There are two transmission methods for transmitting the monitoring results of the CPU module on the host station to the target device; fixed cycle send and condition match send. One of these methods must be selected by the user during programmable controller CPU monitoring registration.

### Fixed cycle send

The monitoring results are transmitted each time the monitoring information is read from the CPU module.

(Timing to transmit data)

## Condition match send

### ■Transmission of monitoring results

For device monitoring, the monitoring conditions registered by the user (conditions for sending monitoring results), the monitoring condition values and the monitoring information read from the CPU module are compared. The monitoring results are transmitted when there is a block where the monitoring conditions match.

For programmable controller CPU status monitoring, the monitoring results are transmitted only once when an error is detected for the first time from the status information read from the CPU module. (This corresponds to the edge triggered transmission described below.)

### ■Edge triggered/level triggered transmission

Two transmission methods of the monitoring results are available for the condition match send for device monitoring: edge triggered transmission and level triggered transmission.

- Edge triggered transmission

The monitoring conditions registered by the user (conditions for transmitting monitoring results), the monitoring condition values and the monitoring information read from the CPU module are compared. Then, the monitoring results are transmitted only once when a satisfaction of the monitoring conditions is detected for the first time.

After that, when the monitoring information read from the CPU module does not match the monitoring conditions and then it matches the monitoring conditions once again, the monitoring results are transmitted.

- Level triggered transmission

The monitoring conditions registered by the user (conditions for transmitting monitoring results), the monitoring condition values and the monitoring information read from the CPU module are compared. While the monitoring conditions are satisfied, the monitoring results are transmitted at each cycle time.

(Timing to transmit data)

## ■Monitoring condition

In the condition match send for device monitoring, the start device for each block is the monitoring target for condition monitoring of each block device.

For the condition match send, the monitoring conditions that can be designated for the device to be registered by the user and the registration values when designating the monitoring condition are listed in the table below.

Register the monitoring conditions for the start device of each block using the following table.

| Monitoring condition                                                 |                                                | Registration value               |                                   | Valid designated device |      |
|----------------------------------------------------------------------|------------------------------------------------|----------------------------------|-----------------------------------|-------------------------|------|
|                                                                      |                                                | For edge triggered transmissions | For level triggered transmissions | Bit                     | Word |
| Device value or status = device monitoring condition value or status |                                                | 0001H                            | 0101H                             | ○                       | ○    |
| Device value or status ≠ device monitoring condition value or status |                                                | 0002H                            | 0102H                             |                         |      |
| Unsigned                                                             | Monitoring device ≤ monitoring condition value | 0003H                            | 0103H                             | ×                       |      |
|                                                                      | Monitoring device < monitoring condition value | 0004H                            | 0104H                             |                         |      |
|                                                                      | Monitoring device ≥ monitoring condition value | 0005H                            | 0105H                             |                         |      |
|                                                                      | Monitoring device > monitoring condition value | 0006H                            | 0106H                             |                         |      |
| Signed                                                               | Monitoring device ≤ monitoring condition value | 0007H                            | 0107H                             |                         |      |
|                                                                      | Monitoring device < monitoring condition value | 0008H                            | 0108H                             |                         |      |
|                                                                      | Monitoring device ≥ monitoring condition value | 0009H                            | 0109H                             |                         |      |
|                                                                      | Monitoring device > monitoring condition value | 000AH                            | 010AH                             |                         |      |

## ■Monitoring condition value, status

In device monitoring, register the monitoring condition value or status for C24 to judge that the numeric value/status of the monitoring device for condition match send (start device of each block) satisfy the condition with numeric values listed below.

| Type of monitoring device | Monitoring condition value or status | Registration value |
|---------------------------|--------------------------------------|--------------------|
| Bit device                | OFF                                  | 0000H              |
|                           | ON                                   | 0001H              |
| Word device               | Numerical value                      | 0000H to FFFFH     |

**Ex.**

Condition satisfies when M0 = ON

·Registration value for the monitoring condition: 0001H

·Registration value for the monitoring condition value or status: 0001H

**Ex.**

Condition satisfies when D0 > 100 (signed)

·Registration value for the monitoring condition: 000AH

·Registration value for the monitoring condition value or status: 100 (64H)

### Point

In status monitoring for the CPU module, the monitoring conditions and condition values for condition match send are not registered.

Instead, it is registered whether or not the status monitoring of CPU module will be performed.

Monitoring results in the condition match send are transmitted only once when an error is detected by the status information read from the CPU module for the first time.

# Transmission methods of monitoring results and data transmitted to the target device

This section explains the transmission method of the CPU module monitoring results and the data to be transmitted to the target device.

## Data transmission to target device communicating with MC protocol

Data is transmitted in the same format as that for a message transmitted with the on-demand function with the on-demand data portion replaced with the device information and programmable controller CPU status information, as explained in "When sending the monitoring results as data during fixed cycle send" or "When sending the monitoring results as data during condition match send" below. (MELSEC Communication Protocol Reference Manual)

### ■When the interface that uses the modem function is set to the MC protocol

The connection processing and disconnection processing to the modem are performed when the programmable controller CPU monitoring results are transmitted.

**Ex.**

Data transmission by MC protocol with modem function (condition match send)

### ■When the transmission of on-demand data using user frames is designated

Data is transmitted in the transmission format for on-demand data using a user frame with the on-demand data portion replaced with the device information and programmable controller CPU status information, as explained in "When sending the monitoring results as data during fixed cycle send" and "When sending the monitoring results as data during condition match send" below.

See the following explanation for data reception for the target device side.

- Device information, programmable controller CPU status information arrangement (MELSEC Communication Protocol Reference Manual)
- Arrangement of data in the user frame portion to be transmitted (Page 299 ON-DEMAND DATA COMMUNICATIONS USING USER FRAMES)

### ■When transmitting the monitoring results as data during fixed cycle send

Data equivalent to the entire blocks of the monitoring target device information and programmable controller CPU status information is transmitted in batch.

### ■When transmitting the monitoring results as data during condition match send

The device information for a block which the monitoring conditions are matched and the programmable controller CPU status information at an occurrence of an error are transmitted with the head data (header) and last data (footer) for the on-demand function added for each block.

Transmission is performed in the order of the programmable controller CPU status information, the device information registered in the word block, and then the device information registered in the bit block.

#### Point

When data is communicated using the MC protocol format 1 to 4, all of the device monitoring start device number is converted to hexadecimal ASCII data and transmitted. (The same conversion is performed during either fixed cycle send or condition match send.)

## Data transmission to target device communicating with nonprocedural protocol

The device information and CPU information are transmitted by the word/byte unit designation.

### ■When ASCII-BIN conversion for communication data is designated

Data is converted to ASCII code data and transmitted. (The transmission example is shown in the "Device information and programmable controller CPU status information".)

- When the word/byte units designation is set to word

The device information and CPU information is transmitted by 1-word in the order of (H) and (L).

- When the word/byte units designation is set to byte

The device information and CPU information is transmitted by 1-word in the order of (L) and (H).

■When the interface that uses the modem function is set to the nonprocedural protocol

The connection processing and disconnection processing to the modem are performed when the programmable controller CPU monitoring results are transmitted.

**Ex.**

☐ Data transmission by nonprocedural protocol with modem function (condition match send)

### ■When transmitting monitoring results as data during fixed cycle send

The device information of one or more user frame numbers and programmable controller CPU status information that have been currently designated for the fixed cycle send in C24 is transmitted in batch.

■When transmitting the monitoring results as data during condition match send

The device information of one or more user frame numbers and programmable controller CPU status information that have been currently designated for the condition match send of the block where the monitoring conditions satisfied in C24 is transmitted in batch.

When the monitoring conditions of two or more blocks match, the device information and programmable controller CPU status information are transmitted for each block.

### Point

When the ASCII-BIN conversion for the communication data using the nonprocedural protocol is performed, all of the device monitoring start device number is converted to hexadecimal ASCII data and transmitted. (The same conversion is performed during either fixed cycle send or condition match send.)

■The user frame numbers that can be designated for data transmission of programmable controller CPU monitoring results

- 1H to 3E7H (Default registration frame numbers)
- 3E8H to 4AFH (Frame numbers registered by the user in the flash ROM)
- 8001H to 801FH (Frame numbers registered by the user in the buffer memory)
- B001H to B01FH (Dedicated frame numbers for this function) (  Page 161 Transmission instruction of device information and programmable controller CPU status information when transmitting the monitoring results)

For details on how to designate user frame numbers, refer to the following section.

Page 308 DATA COMMUNICATIONS USING USER FRAMES

## ■Transmission instruction of device information and programmable controller CPU status information when transmitting the monitoring results

Use the following dedicated user frame numbers.

| Frame No. | Information to be transmitted                                              |           | Valid function   |                      |
|-----------|----------------------------------------------------------------------------|-----------|------------------|----------------------|
|           |                                                                            |           | Fixed cycle send | Condition match send |
| B001H     | Device information for the block registered in number n                    | Number 1  | ○                | ○                    |
| B002H     |                                                                            | Number 2  |                  |                      |
| B003H     |                                                                            | Number 3  |                  |                      |
| B004H     |                                                                            | Number 4  |                  |                      |
| B005H     |                                                                            | Number 5  |                  |                      |
| B006H     |                                                                            | Number 6  |                  |                      |
| B007H     |                                                                            | Number 7  |                  |                      |
| B008H     |                                                                            | Number 8  |                  |                      |
| B009H     |                                                                            | Number 9  |                  |                      |
| B00AH     |                                                                            | Number 10 |                  |                      |
| B061H     | Programmable controller CPU status information (CPU error monitoring data) |           | ○                | ○                    |
| B080H     | Number of blocks to be sent                                                |           | ○                | ○                    |
| B081H     | Monitoring result information for all blocks                               |           |                  |                      |
| B082H     | Monitoring result information for blocks satisfying the conditions         |           | ×                | ○                    |

## ■Device information and programmable controller CPU status information

It is transmitted in the order of data shown below.

 Page 162 Data arrangement of device information and programmable controller CPU status information

For ASCII-BIN conversion, set "ASCII-BIN conversion designation" to "ON".

When user frame is designated with the number, of which bit 14 for the numeric value indicating the user frame number is ON, ASCII-BIN conversion of the corresponding send data is not performed. It will be transmitted as binary data. ( Page 380 ASCII-BIN Conversion for Data Communicated with Nonprocedural Protocol)

# Data arrangement of device information and programmable controller CPU status information

## When user frame numbers B001H to B00AH are designated (example for one block)

### ■When word device data (W100 to W103, (4 points)) is transmitted

When the word/byte units designation is set to word unit, the device data will be transmitted in the order of (H)→(L).

The number of registered points is the number of points in word units.

- (When ASCII-BIN conversion is not performed)

The total number of bytes for the device data portion is the number of device points × 2.

When the word/byte units designation is byte

When the word/byte units designation is word

- (When ASCII-BIN conversion is performed)

The total number of bytes for the device data portion is the number of device points × 4.

When the word/byte units designation is byte

When the word/byte units designation is word

## When user frame No. B061H is designated

Programmable controller CPU status information (for one block) is transmitted as the following data:

| Item                        | Communicating with ASCII code              | Communicating with binary code | Remarks         |
|-----------------------------|--------------------------------------------|--------------------------------|-----------------|
| Device code                 | '01'                                       | 01H                            | All fixed value |
| Number of registered points | '0001'                                     | 0001H                          |                 |
| Monitoring start device     | '000000'                                   | 000000H                        |                 |
| Device data                 | During normal operation                    | '0000'                         |                 |
|                             | Module warning occurring                   | '0001'                         |                 |
|                             | Module error/module system error occurring | '0002'                         |                 |

- (When ASCII-BIN conversion is not performed)

The total number of bytes for the device data portion is the number of device points  $\times$  2.

When the word/byte units designation is byte

| Device code |     | Monitoring start device |     | Number of registered points |     | Device data |     |
|-------------|-----|-------------------------|-----|-----------------------------|-----|-------------|-----|
| L           | H   | L                       | H   | L                           | H   | L           | H   |
| 01H         | 00H | 00H                     | 00H | 01H                         | 00H | 01H         | 00H |

When the word/byte units designation is word

| Device code |     | Monitoring start device |     | Number of registered points |     | Device data |     |
|-------------|-----|-------------------------|-----|-----------------------------|-----|-------------|-----|
| L           | H   | L                       | H   | H                           | L   |             |     |
| 01H         | 00H | 00H                     | 00H | 01H                         | 00H | 00H         | 01H |

- (When ASCII-BIN conversion is performed)

The total number of bytes for the device data portion is the number of device points  $\times$  4.

When the word/byte units designation is byte

| Device code     |                 | Monitoring start device |                  |                  |                  |                  |                  | Number of registered points |                  |                  |                  | Device data      |                 |                  |                  |                  |

## When user frame No. B080H is designated

The transmission block is transmitted as follows.

**Ex.**

Number of registered word blocks: 2 (D0 to D3 (4 points), W100 to W107 (8 points))

Number of registered bit blocks : 1 (M0 to M31 (2 points))

(When ASCII-BIN conversion is not performed)

|                                  |                                 |                         |
|----------------------------------|---------------------------------|-------------------------|
| Number of registered word blocks | Number of registered bit blocks | CPU abnormal monitoring |
| 02H                              | 01H                             | 00H                     |

(When ASCII-BIN conversion is performed)

|                                  |     |                                 |     |                         |     |
|----------------------------------|-----|---------------------------------|-----|-------------------------|-----|
| Number of registered word blocks |     | Number of registered bit blocks |     | CPU abnormal monitoring |     |
| H                                | L   | H                               | L   | H                       | L   |
| 0                                | 2   | 0                               | 1   | 0                       | 0   |
| 30H                              | 32H | 30H                             | 31H | 30H                     | 30H |

- The total number of bytes for the device data portion is the number of device points  $\times$  4.  
When the word/byte units designation is byte

When user frame No. B082H is designated

Information on the monitoring results for the condition matched blocks are transmitted for each block.  
Results are transmitted in the order of the programmable controller CPU status information, the device information registered in the word block and then the device information registered in the bit block.

Ex.

Number of registered word blocks: 2 (D0 to D3 (4 points), W100 to W103 (4 points))

Number of registered bit blocks : 1 (M0 to M15 (1 point))

When the condition satisfied monitoring device is W100 = 0 and M0≠ON

- (When ASCII-BIN conversion is not performed)

The total number of bytes for the device data portion is the number of device points × 2.

When the word/byte units designation is byte

For W100 to W103 block data

For M0 to M15 block data

When the word/byte units designation is word

For W100 to W103 block data

For M0 to M15 block data

- The total number of bytes for the device data portion is the number of device points  $\times 4$ .

For W100 to W103 block data

# Execution order for using the programmable controller CPU monitoring function

This section explains the execution order to use the programmable controller CPU monitoring function.

- When transmitting the monitoring results with the modem function, configure the following settings in order to use the modem function.

| Setting item                                                                  | Reference                                                                                                  |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Initial setting using the Engineering tool                                    | Page 206 Initial settings of Serial communication module                                                   |
| Registration of data number for initialization and data number for connection | Page 209 Register/read/delete data for initialization<br>Page 213 Register/read/delete data for connection |
| Initialization of C24 modem/TA                                                | Page 217 Initialization of modem/TA (terminal adapter)                                                     |

- Register programmable controller CPU monitoring for C24 using one of the methods shown below.  
Registration with Engineering tool  
Registration using the programmable controller CPU monitoring registration command (0630) for communication with the MC protocol (📖 MELSEC Communication Protocol Reference Manual)  
Registration by the dedicated instruction for the CPU module (CSET) (📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions))
- By registering programmable controller CPU monitoring, C24 monitors the CPU module on the host station regardless of the RUN/STOP status and sends the monitoring information to the target device.
- When reregistering programmable controller CPU monitoring in order to change the registration data for the programmable controller CPU monitoring, reregister after canceling the programmable controller CPU monitoring.  
When registering with communication using the MC protocol (📖 MELSEC Communication Protocol Reference Manual)  
When registering by "CSET" instruction for the CPU module (📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions))  
To cancel by using Engineering tool, set the CPU module in the STOP status first to configure the settings again, and then restart the CPU module.

## 8.3 Settings for Using the Programmable Controller CPU Monitoring Function

This section describes system settings required for fixed cycle send and condition match send.

### Parameter setting items for the programmable controller CPU monitoring function

The following explains parameter setting items for the programmable controller CPU monitoring function.

Configure the parameter settings.

 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ Module Name ⇒ [Module Parameter] ⇒ "Application Settings" ⇒ "Programmable Controller CPU monitoring function setting"

#### Point

- Register send user frames by Engineering tool, after checking the specifications and setting methods explained in the following sections. ( Page 282 CONTENTS AND REGISTRATION OF USER FRAMES FOR DATA COMMUNICATION, Page 308 DATA COMMUNICATIONS USING USER FRAMES)
- Register connection data for the modem function by Engineering tool, after checking the specifications in the following section. ( Page 214 Method to register/read/delete data for connection)

### Setting items and requirement for communication using the MC protocol

○: Setting required, ×: Setting not required

| Setting item                                                                  |                                            | Fixed cycle send | Condition match send | Reference                                                                                                  |

## Contents of setting items

The following shows the data setting items with Engineering tool and the setting contents to use the programmable controller CPU monitoring function.

### ■Programmable controller CPU monitoring function designation

Designate the timing (fixed cycle send or condition match send) when transmitting information on the programmable controller CPU monitoring results (device information/CPU status information) to the target device.

- The conditions for condition match send are designated using data items in "Monitoring condition specification (Judgment condition specification)" and "Monitoring condition value designation".

### ■Cycle time units designation

- Designate the unit for cycle time for reading information from the CPU module using the programmable controller CPU monitoring function.
- The time designated by "Cycle time units designation" and "Cycle time designation (programmable controller CPU monitoring interval time)" is also used as the transmission time interval for fixed cycle send.

### ■Cycle time designation (Programmable controller CPU monitoring interval time)

Designate the time for one cycle when reading information from the CPU module in order to perform programmable controller CPU monitoring function.

- The time designated for "Cycle time designation (Programmable controller CPU monitoring interval time)" is also used as the transmission time interval for fixed cycle send.

### ■Registered word block quantity designation, Registered bit block quantity designation

Designate the number of word device blocks (number of registered word blocks) and the number of bit device blocks (number of registered bit blocks) registered in C24 as the target when performing device data monitoring or transmission.

### ■CPU error monitoring designation

Designate whether or not C24 monitors abnormality of the CPU module on the host station (status monitoring) in the programmable controller CPU monitoring.

### ■Monitoring device designation, start device number designation, number of read points designation

When performing device data monitoring or transmission, designate the device range for each block for the number of blocks designated by "Registered word block quantity designation" and "Registered bit block quantity designation".

The target of device data monitoring for condition match send is the start device for each block.

Word device designated block: Head word device (for one word)

Bit device designated block : Head bit device (for one bit)

- The monitored device is the item that indicates the target device of the corresponding block and designated with the codes below. (📖 Page 154 List of device code)
- The start device is the data that designates the head of the target device range for the corresponding block.
- The number of read points (number of registered point) is the item that indicates the target device range for the corresponding block which designate points from the start device number.  
The bit device designates points in word units (1 point = 16 bits).
- The methods for designating these data are the same as the designation methods used when reading from or writing to the device memory, which are described in the following manual.  
(📖 MELSEC Communication Protocol Reference Manual)

#### Point

When the user performs the programmable controller CPU monitoring registration, the device No. will designated in either a decimal or hexadecimal depending on devices. The number of read points (number of registered points) are designated in hexadecimal.

However, for data communication using either MC protocol (format 1 to 4) or nonprocedural protocol, when ASCII-BIN conversion of the communication data has been designated, the start device number for all devices to be transmitted to target devices as the monitoring results will be converted to hexadecimal ASCII data and transmitted.

### ■Monitoring condition specification (Judgment condition specification)

When the condition match send is designated by the "Programmable controller CPU monitoring function designation", designate the conditions for transmitting information for the "Monitoring condition value designation".

### ■Monitoring condition value designation

When the condition match send is designated by the "Programmable controller CPU monitoring function designation", this data designates the status/numeric value for "Monitoring condition specification (Judgment condition specification)".

- When the monitoring device is a word device: Designate the monitoring condition value with a numeric value
- When the monitoring device is a bit device : Designate the monitoring condition with a numeric value (1/0) corresponding to ON/OFF.

## Setting items for transmitting monitoring results

The following shows an example of setting items and data transmission when sending the monitored results of the programmable controller CPU monitoring function to the target device using the nonprocedural protocol.

**Ex.**

This example shows when the D0 to D3 device information and user frame data are transmitted by the edge triggered transmission method with a condition of D0 = 0.

The setting is configured in the parameters of Engineering tool.

# How to register and cancel the programmable controller CPU monitoring function

The following shows the method to register/cancel the programmable controller CPU monitoring function from the CPU module.

## Point

- For details on the method for registering or canceling the programmable controller CPU monitoring with a command of MC protocol, refer to the following manual.  
( MELSEC Communication Protocol Reference Manual)

## When registering or canceling from the CPU module

For details on the CSET command, refer to the following section.

 Page 580 Dedicated Instructions

- Store the data for programmable controller CPU monitoring registration in the device that designates the control data for the CSET instruction.
- Execute the CSET instruction.  
At the end of the scan in which the CSET instruction was completed, the completion device (M0) designated by (D2) turns ON and then turns OFF at the next END processing.
- When an error occurs, (D2) + 1 turns ON and the error code is stored in the completion status (S2) + 1.

This example shows a program that registers programmable controller CPU monitoring for the CH1 side interface.

This registration is for transmitting the contents of M0 to M15 and D100 to D109 to the target device using the fixed cycle send (cycle time is 3 min).

- (0) Set the command pulse.
- (3) Execute the programmable controller CPU monitoring registration.
- (19) Processing for normal completion or abnormal completion

## 8.4 Considerations for Using the Programmable Controller CPU Monitoring Function

### Influence on the cycle time

The cycle time will be affected by the following factors.

Keep these in mind when setting the cycle time.

- When the programmable controller CPU is accessed by a module other than C24.
- When a data communication function other than the programmable controller CPU monitoring function is used.
- When transmission interruption occurs by DTR/DSR control.

### Mixing of fixed cycle send and condition match send

Both of the fixed cycle send and the condition match send cannot be designated together for the same interface.

### Target CPU module

Only the CPU module on the host station can be the target for the programmable controller CPU monitoring function.

### Registration during operation

A new programmable controller CPU monitoring registration cannot be performed while the programmable controller CPU monitoring function is in operation.

- Perform the new programmable controller CPU monitoring registration after canceling the programmable controller CPU monitoring.
- If the programmable controller CPU monitoring registration is performed without canceling the monitoring, an error will occur.  
Before performing the programmable controller CPU monitoring registration with Engineering tool, set the CPU module in the STOP state, and then restart the CPU module.

### Error during operation

While the programmable controller CPU monitoring function is in operation, even if an error occurs in transmission of the CPU module monitoring results or reading of data from the CPU module, the programmable controller CPU monitoring function operation will not stop.

### System configuration

The programmable controller CPU monitoring function can be used when the system configuration is in a 1:1 basis.

## Operation when information cannot be transmitted to target device

The following describes how C24 operates when the information of the programmable controller CPU monitoring results cannot be sent to the target device due to line disconnection or other reasons.

Even if an error occurs while the programmable controller CPU monitoring function is in operation, the ERR LED does not turn ON. (This is the same as when using the on-demand function of the MC protocol.)

### ■When the setting for the send monitoring time designation (timer 2) is 'Unlimited wait' (0H)

- Reading of monitoring data from the CPU module stops until the transmission of the monitoring data is completed.
- When transmission resumes, reading of monitoring data from the CPU module resumes and monitoring data and information are transmitted.

### ■When the setting for the send monitoring time designation (timer 2) is other than 'Unlimited wait' (0H)

- A transmission timeout error occurs. Reading of monitoring information from the CPU module and transmission of the information resumes.
- The error code is stored in the 'programmable controller CPU monitoring function execution result (current)' (Un\G8709/8965).

## When CPU module error occurs

When device data for the programmable controller CPU cannot be read because of a CPU module error (hardware failure, etc.), the error code is stored in the programmable controller CPU monitoring function error code storage area and C24 performs the monitoring processing based on previously read data.

## Modem connection error

When the monitoring information is transmitted with the modem function, a modem connection error will occur if a modem connection request is issued for the following reason.

- Connection request by the 'connection request' (Y11)

If possible, provide a dedicated C24 for using the programmable controller CPU monitoring function.

When using both the programmable controller CPU monitoring function and data communication function with a single C24 and one of the above modem connection errors occurs, re-execute a connection request in consideration of the transmission timing set by the user for the programmable controller CPU monitoring function.

# 9 COMMUNICATIONS BY THE MODEM FUNCTION

This chapter explains the overview and how to use the modem function, which can be used for data communication with remote target devices.

For the transmission specification on C24 side, connectable modems/TA's (terminal adapter) for the usage of the modem function, refer to the following manual.

📖 MELSEC iQ-R Serial Communication Module User's Manual(Startup)

## 9.1 Overview

The modem function easily performs data transmission/reception to remote devices via public lines/office telephone systems/digital lines (ISDN) by connecting a modem or TA (terminal adapter) to RS-232 interface of C24.

Initialization of the modem or TA, line connection (dialing), and modem disconnection are performed by CPU module.

Once the line is connected, data communication with the target device via public line/office telephone system/digital line can be performed.

\*1 TA indicates the abbreviation for the terminal adapter.

### Point

The modem function does not support dedicated lines.

When transmitting/receiving data via a dedicated line, prepare a modem having an automatic connection function and supporting dedicated lines.

This chapter can be skipped because data can be transmitted/received without using the modem function when transmitting/receiving data via a modem having an automatic connection function and supporting dedicated lines.

Automatic connection function: Indicates a function for connecting to the modem of the target device automatically. (The function name varies depending on the manufacturer of the modem.)

## Features

The following explains the features of the modem function.

### Interface that can use the modem function

- The modem function can be used with an RS-232 interface of C24.
- For the RJ71C24-R2, the modem function can be used for only one of the two RS-232 interfaces.  
With the other interface of C24, direct data communication with a target device can be performed using MC protocol, nonprocedural protocol, or bidirectional protocol (independent operation).

### Initialization/connection/disconnection of modem or TA

- The following setting value for line connection can be used by registering in the module extended parameter or flash ROM of C24 in multiple sets.  
Data for Modem/TA initialization (AT command)  
User setting: 30 sets (78 bytes/set), default value: 13 sets  
Data for connection  
User setting: 30 sets (80 bytes/set) (display message to telephone number of the connection destination, line type, etc.)
- By registering the above data to C24 in advance, the modem/TA (terminal adapter) initialization, line connection (dialing), and line disconnection can be performed easily.
- When the no-communication interval time (1 min to 120 min) is set, C24 disconnects the line when a no-communication condition continues for the set period of time following the line connection.

### Communication between remote device and CPU module

- Data communication can be performed via full-duplex communication.
- From the target device to the CPU module, communication using the MC protocol, nonprocedural protocol, or bidirectional protocol can be performed.
- From the CPU module to the target device, communication using the MC protocol (transmission by the on-demand function only), the nonprocedural protocol, or bidirectional protocol can be performed.

## Remote password check

If the remote password check has been set for C24, the C24 performs a remote password check when accessing to the programmable controller from a target device using the C24 modem function.

The following is an overview of the CPU module remote password function.

 Page 187 Applicability of remote password function

### ■Remote password function

The remote password function allows/prohibits access to the CPU module from a target device via the following modules.

- C24
- Ethernet module
- Built-in Ethernet port CPU

In the case of the Ethernet module, the remote password function can be used for data communications connections with a target device. For details, refer to following manual.

 MELSEC iQ-R Ethernet User's Manual (Application)

### ■Station to which the remote password and remote password check are set

- When a programmable controller system with one CPU module station

Parameter setting with Engineering tool

- Remote password
- Module subject to the remote password check

- When a programmable controller system consisted of multiple CPU module stations

Set to the CPU module station (the CPU module on the host station in the figure below) which is the entrance of the programmable controller system as viewed from the target device.

When set to a station other than the CPU module which is the entrance of the programmable controller system (relay station or access station in the above figure), access to other stations beyond the set station is prohibited.

## Function list

The modem function overviews are as follows:

| Function                                                | Overview                                                                                                                                                                                                                            |                                                                      |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Modem/TA initialization                                 | Initializes the modem/TA using the user-designated initialization data (AT command). (Auto initialization of the modem/TA is possible.)                                                                                             |                                                                      |
| Line connection (dialing)                               | Dials the target telephone number according to the user-designated data for connection and enables data communication after establishing the line connection.<br>When the modem/TA is not initialized, performs the initialization. |                                                                      |
| Data communication                                      | Performs communication with a target device using the MC protocol, nonprocedural protocol, or bidirectional protocol.                                                                                                               | Communication method: full-duplex communication                      |
|                                                         | Performs communication with the target C24-installed station by modem/TA connection using nonprocedural protocol or bidirectional protocol. (Station-to-station communication)                                                      | Synchronization method:<br>Asynchronous communication (asynchronous) |
| Modem disconnection                                     | Disconnects forcefully the line to the connected target device.                                                                                                                                                                     |                                                                      |
| Flash ROM reading, writing (registration), and deletion | Reads, writes (registers) and deletes the initialization data (AT command) and data for connection from/to the flash ROM in C24 according to the request from CPU module.                                                           |                                                                      |
| Remote password check                                   | Allows C24 to execute the check of the remote password set in the CPU module when communication from a target device to C24 is performed using the MC protocol.                                                                     |                                                                      |

## 9.2 System Configuration

This section explains the system configurations when the modem function is used to perform data communication with a target device via public lines.

### System configuration when performing data communication with target device

The following shows the system configuration examples used for data communications between a target device and CPU module using the MC protocol/nonprocedural protocol/bidirectional protocol of C24.

#### Connection example to a target device

#### Connection example to C24

- The public lines indicated above are compatible with the office telephone system as well.
- For connection to a target device or C24, the digital line (ISDN) can be replaced by the public line.  
When connecting via a digital line, a TA (terminal adapter) and a DSU (digital service module) are used instead of a modem.

## Considerations for system configurations

The following shows considerations for the system configurations to perform data communication with a target device via public line, an office telephone system or digital line (ISDN) using the modem function.

### Usable C24 interface

- The modem function can be used for the RS-232 interface only.
- For the RJ71C24-R2, the modem function can be used for only either one of the two RS-232 interfaces.
- Interactive data communication via two interface of C24 (interlink operation) is not available.

### Connectable modem/TA

Only the modems/TA shown below can be used for the C24 RS-232 interface to use the modem function.

📖 MELSEC iQ-R Serial Communication Module User's Manual(Startup)

### Number of connectable modems/TAs

Only one modem/TA can be connected to the C24 RS-232 interface to use the modem function.

### Modem/TA connection cables

- Perform the wiring connection as designated on the modem/TA side for connection between C24 and modem/TA.
- For the RS-232 interface of C24, a D-sub 9-pin connector (female) is used.  
For the connection cable of C24 side, refer to the following manual.  
(📖 MELSEC iQ-R Serial Communication Module User's Manual(Startup))

### Modem/TA installation

- Install the modem/TA according to the modem/TA manual.  
Installing it in an area where a lot of noises are generated may cause malfunctions.
- In order to prevent the effects of noise and power surges, do not connect near or tie the cable together with a main circuit line, high-voltage line or load line other than for the programmable controller with the modem/TA connection cable.

### Connectable lines

- The connections with the following lines, which are equivalent to NTT communication protocol are available.  
Perform connection tests beforehand and confirm that connection is possible.  
Public line or office telephone system of analog two-line method  
Digital line (ISDN)
- It is not possible to connect to call-waiting lines, in order to avoid data errors or automatic line disconnection due to the call-waiting interrupt tone.
- Avoid connections with party-line telephones to avoid interrupted calls during communication.
- If an alert sound is sent at fixed intervals from the communication machine to prevent long-term calls, data corruption may occur.  
Transmitting a response for normal/abnormal data reception between devices, and performing transmission retry processing when any abnormality is detected is recommended.
- Refer to the manuals for a modem/TA for connection from a modem to public line/office telephone system, or for connection from a TA to a digital line.

## Communication method

Communication via the modem function is performed using full-duplex communication.

Connections to devices designed for half-duplex communication is not available.

## Data communication to target devices

- Data communication with target devices is performed using the public line or electric wave transmitted from the electric wave transmission base.

In some conditions, normal data communication may not be carried out due to the system installation environment, electric-wave transmission status, error in the target device, or other reasons.

Perform a connection test beforehand, and confirm that connection is possible.

## 9.3 Specifications of Modem Function

This section explains the applicability to the remote password function, input/output signals and buffer memory related to the modem function.

### Applicability of remote password function

The following explains C24 data communication for the remote password function of the CPU module.

For an overview of the C24 check function for the CPU module remote password, refer to the following section.

 Page 182 Remote password check

#### Precautions

The remote password function cannot prevent improper access completely.

Incorporate the user's own safeguards when it is necessary to protect the security of the programmable controller system from improper access from an external device.

Mitsubishi Electric Corporation cannot be held responsible for any system problems that may occur from unauthorized access.

#### ■Countermeasures for preventing unauthorized access

- Install a firewall.
- Install a personal computer as a relay station and control the relay station of the transmission/receive data using application programs.
- Install an external device whose access authority can be controlled.

For the external devices whose access authority can be controlled, contact the network provider or distributor of devices.

## Data communication when remote password is set

This section explains how to use and set the CPU module remote password function, and data communication between the target device and the CPU module when a remote password has been set.

### ■Permitting/prohibiting access from target device to programmable controller

#### ① Access permission processing (unlock processing)

- To access to the specified CPU module, the target device performs the remote password unlock processing to the C24<sup>\*1</sup> on the directly connected station (host station) after line connection for the modem function.
- If the unlock processing has not been performed, accessing to the specified station is prohibited by the remote password check performed by C24<sup>\*1</sup>, which received the communication request.

( Page 190 Remote password check processing performed by C24)

- All received data before the unlock processing is performed will be processed as an error.

<sup>\*1</sup> It indicates the C24 on the CPU module station to which a remote password is set.

#### ② Access processing

- Normal completion of the remote password unlock processing allows the access to the specified station.
- Perform communication using the MC protocol.

#### ③ Access prohibition processing (lock processing)

- To complete the access to the specified station, perform the line disconnection processing for the modem function in order to disable further access.
- When the modem disconnection is completed, the remote password lock processing is performed automatically.

(When accessing the host station RCPU)

(When accessing other station RCPU)

<sup>\*1</sup> Unlock and lock processing of the remote password for the host station is possible.

Remote password unlock and lock processing for the relay station and access station cannot be performed.

<sup>\*2</sup> Lock processing is performed when a line for the modem function is disconnected.

<sup>\*3</sup> For an Ethernet module which transmits a communication request to other Ethernet, the unlock and lock processing is not necessary even it is set as the subject of remote password check.

**Restriction** 

The remote password unlock and lock processing can be performed to the C24 on the host station directly connected to the target device.

The remote password unlock and lock processing cannot be performed for the Ethernet module of the other stations (relay station and access station).

**Point** 

- The remote password unlock processing from a target device is performed using dedicated commands for MC protocol communication.
- For corrective actions for abnormal completion of the remote password unlock processing, refer to the following section.

(  Page 198 Considerations for using the modem function)

## Remote password check processing performed by C24

### ■Communication in which a remote password check is performed

① When the following parameters are set for the C24 mounted on the host station CPU module, the C24 performs a remote password check for communication requests listed below.

- When a remote password is set in the CPU module.
- When C24 that is communicating data with the target device has been set as a module subject to the remote password check.

② C24 performs a remote password check with respect to a communication request to the host station/other station received from the target device.

③ C24 does not perform a remote password check for the following communication requests.

- Transmission request from the CPU module on the host station (such as transmission using nonprocedural protocol)
- Communication request from the target device (including Engineering tool connected to the CPU module on the host station) transmitted to other station upon request from the CPU module.

\*1 In the above figure, a communication request from the target device cannot be received since the remote password check setting has been configured.

If the remote password check setting has not been configured, a communication request can be received and data communication from the target device is possible.

### ■Selecting modules to which remote password check is performed

C24 to which the remote password check is performed can be selected by the user, and it will be set by the parameters of the CPU module.

(This is set on the "Remote Password Setting" screen of Engineering tool.)

### ■ Stations that can be accessed when the remote password check is performed

- The remote password unlock processing to the C24 on the directly connected station (host station) after line connection for the modem function enables the target device to access to the CPU module on the host station.
- When accessing the programmable controller on other stations via the Ethernet module on a relay station or access station, the access is allowed/prohibited by the settings below.

To prohibit access to other station from a target device using the IP packet transfer function of the Ethernet module, select the checkbox for "MELSOFT Transmission Port (UDP/IP)" on the "Remote Password Detail Setting" screen for the relay station or access station.

For the stations that can be accessed when accessing to the CPU module on the other stations via Ethernet module, refer to the following manual.

(Refer to it by substituting the station connected to a target device with C24.)

( MELSEC iQ-R Ethernet User's Manual (Application))

### Data communication procedure

The following shows the procedure when a target device performs data communication via C24 to which the remote password check is performed.

1. Initialization of the modem on the C24 side and target device side is performed at each device sides.
2. The line is connected from the target device.
3. The target device performs the remote password unlock (release) processing for the CPU module on the station where C24 is mounted using dedicated commands for MC protocol communication.  
(The unlock processing cannot be performed for the CPU module of other station.)  
For what to do when the remote password unlock processing is completed abnormally, refer to the following section.  
( Page 182 Remote password check)
4. Data communication is performed from the target device using MC protocol.
5. When data communication using MC protocol is completed, a line for the modem is disconnected from the target device.  
When line disconnection is completed, the remote password lock processing is performed automatically.

### ■ Remarks

- For more details on the unlock processing command to the remote password, refer to the following manual.  
( MELSEC Communication Protocol Reference Manual)

### How to set the remote password

For the remote password setting method, refer to the following manual.

( GX Works3 Operating Manual)

## List of input/output signals for the modem function

The input/output signals to/from the CPU module for the modem function are shown below.

For information on the input/output signals not related to the modem function, refer to the following section.

 Page 545 Input/Output Signal List

### Ex.

The start I/O number of C24 is '0030'. ('n' indicates start I/O number of C24.)

Xn0 to X(n+1)F → X30 to X4F, Yn0 to Y(n+1)F → Y30 to Y4F

### Function and description of input/output signal

| I/O signal | Signal name                                    | Function/description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Description                                                                        |
|------------|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| X10        | Modem initialization completion                | Indicates the normal completion of the initialization for the modem/TA connected to the host station side by C24 according to the initialization data designated.                                                                                                                                                                                                                                                                                                                                     | Page 217 Initialization of modem/TA (terminal adapter)                             |
| X11        | Dialing                                        | Indicates that C24 is dialing (performing connection processing) the target device side according to the data for connection designated.                                                                                                                                                                                                                                                                                                                                                              | Page 222 Line connection                                                           |
| X12        | Connection                                     | <ul style="list-style-type: none"> <li>Indicates normal completion of the line connection processing from or to the target side.</li> <li>When this signal is ON, data communication with the target device is possible.</li> </ul>                                                                                                                                                                                                                                                                   |                                                                                    |
| X13        | Initialization/connection abnormal completion  | <ul style="list-style-type: none"> <li>Indicates abnormal completion of the modem/TA initialization or line connection processing (dialing) to the target device.</li> <li>Check the cause of the abnormal completion in the modem-error code storage area (address: 221H) and take corrective actions.</li> </ul>                                                                                                                                                                                    | Page 217 Initialization of modem/TA (terminal adapter)<br>Page 222 Line connection |
| X14        | Modem disconnection completion                 | Indicates that the line for data communication with the target device has been disconnected.                                                                                                                                                                                                                                                                                                                                                                                                          | Page 234 Line disconnection                                                        |

| Y12        | Modem disconnection request                    | Indicates a line disconnection request to the target device upon completion of data communication.                                                                                                                                                                                                                                                                                                                                                                                                    | Page 234 Line disconnection                                                        |

### Point

The descriptions hereafter show an example in which I/O numbers of the C24 are assigned to X/Y00 to X/Y1F.

## Buffer memory

The buffer memory to be used for the modem function is shown below.

For the buffer memory that are not related to the modem function, refer to the following section.

 Page 550 Buffer memory list

### Point

Read/write the setting values from/to the buffer memory using Engineering tool.

This section provides supplementary explanations on setting values used to perform settings and monitoring with an Engineering tool.

## Precautions

Do not write data in the system area of the buffer memory.

If data is written in the system area, the programmable controller system may operate abnormally.

The system area exists in the user area partially. Therefore, take caution when reading from/writing to the buffer memory.

## Details of the buffer memory (for modern function)

### ■Modem connection CH specification (Un\G46)

Designate the interface on the C24 side to which a modem/TA is connected.

### ■Connection retry count designation (Un\G48)

- Designate the number of retries for the connection request when the connection could not be made to the target device by the connection request.
- Using the default value for the connection re-try count is recommended.

### ■Connection retry interval designation (Un\G49)

- Designate the interval time of the retry processing for the connection request when the connection could not be made to the target device by the connection request.
- The default value is recommended to use for the connection retry interval.

### ■Initialization/connection timeout designation (Un\G50)

- Designate the following wait time:  
Wait time until the modem/TA initialization is complete  
Wait time per wait when the connection could not be made to the destination by the connection request
- The default value is recommended to use for the initialization/connection retry timeout.

### ■Number of initialization retries designation (Un\G51)

Designate the number of retries when the initialization by the initialization request to the modem on the C24 side has failed.

### ■Data No. for initialization designation (Un\G52)

- Designate the registration number of data for initialization which is transmitted by the initialization request to the modem on the C24 side.  
The registration number is the number registered in C24.
- For details on the designation by program, refer to the following section.  
( Page 217 Initialization of modem/TA (terminal adapter))

### ■Data No. for connection designation (Un\G53)

- Designate the registration number of the data for connection used by C24 for the connection processing to the target device in order to perform data communication.

The registration number is the number registered in C24.

- For details on the designation by program, refer to the following section.

( Page 222 Line connection)

### ■No-communication interval time designation (Un\G55)

- Designate the wait time until the line is closed when the data communication has ceased with the target device after the line connection.

- C24 automatically performs the line disconnection processing when no data communication is performed with the target device for a designated time.

The 'Connection' (X12) and the 'Modem initialization completion' (X10) are turned OFF and the 'Modem disconnection completion' (X14) is turned ON when the line disconnection processing is performed.

### ■RS/CS control enable/disable designation (Un\G56)

- Designate whether or not the control to notify the data reception capability on the host station to the target side with the RS/CS signal during data communication between C24 and modem/TA.

- This setting is for the interface designated for the modem connection channel indicated in the 'Modem connection CH specification' (Un\G46).

The control of the other interface that does not use the modem function is performed by the settings in the 'DTR/DSR (ER/DR), DC control designation' (Un\G147/307).

#### Point

The overview of the RS/CS control is shown below.

- When transmitting data

- C24 detects the modem/TA data reception capability by ON/OFF of the CS (CTS) signal.

- When the CS (CTS) signal is ON, data transmission from C24 starts or continues.

When the CS (CTS) signal is OFF, data transmission from C24 is interrupted.

- When receiving data

- The C24 side reception capability is notified to the modem/TA by ON/OFF of the RS (RTS) signal.

- When the RS (RTS) signal is ON, C24 can receive data. Start/continue data transmission from the modem/TA to C24.

When the RS (RTS) signal is OFF, C24 cannot receive data. Cancel data transmission from the modem/TA to C24.

- C24 turns ON/OFF the RS (RTS) signal in the following conditions:

ON → OFF control of the RS (RTS) signal

C24 turns OFF the RS (RTS) signal when the free OS area for receive data storage becomes 64 bytes (default) or less.

OFF → ON control of the RS (RTS) signal

C24 turns ON the RS (RTS) signal when the free OS area for receive data storage becomes 263 bytes (default) or more.

### ■Modem function error code (Un\G545)

- Error code for an error occurred while the modem function is used or when abnormal signal ('Initialization/connection abnormal completion' (X13)) turns ON is stored.

- For information on error codes, refer to the following section.

( Page 519 Error Code List)

### ■Modem function sequence status (Un\G546)

- The current status while the modem function is used is stored as a number.
- For information on the storage value of the modem function sequence status when using the modem function, refer to the following section.

(☞ Page 204 Startup procedure of the modem function)

### ■Number of data registration for connection (Un\G547)

- The number of registered data for connection, which has been registered in the flash ROM, used by C24 for connection processing with the target device to perform data communication is stored.

The number of registration is the number of data for connection registered in the flash ROM by the user.

- For details on registration of data for connection, refer to the following section.

(☞ Page 213 Register/read/delete data for connection)

### ■Data registration status for connection (for confirmation of registration No.) (Un\G548 to 549)

- The registration status of data for connection, which has been registered in flash ROM, used by C24 for the connection processing with the target device to perform data communication is stored.
- The registration status of each data for connection with registration numbers, No.BB8H to BD5H (3000 to 3029), is indicated in the corresponding bit in the range shown in the figure below.

### ■Number of data registration for initialization (Un\G550)

The number of registered data for initialization, which has been registered in the flash ROM, transmitted to the modem connected to the C24 side for initialization request.

The number of registrations is the number of data for initialization registered in the Flash ROM by the user.

### ■Data registration status for initialization (for confirmation of registration No.) (Un\G551 to 552)

- The registration status of data for initialization, which has been registered in flash ROM, transmitted to the modem connected to the C24 side for initialization request.
- The registration status of each data for initialization with registration numbers, No.9C4H to 9E1H (2500 to 2529), is indicated in the corresponding bit in the range shown in the figure below.
- For details on registration of data for initialization, refer to the following section.

(☞ Page 209 Register/read/delete data for initialization)

- The initialization data or data for connection can be registered in the buffer memory as well as the flash ROM of C24.

A registration number to register data for initialization or data for connection to the buffer memory is in the range of -32767 to -32737 (8001H to 801FH) respectively, which is determined by the area to be used.

- Buffer memory address      Un\G6912      b15      to      b0
- |          |            |
|----------|------------|
| Un\G6912 | 0 to 78/80 |
| ⋮        | ⋮          |
| Un\G8142 | 0 to 78/80 |
- (Number of bytes)
- 0: No registration data  
1 to 78: Registration data exists (for initialization)  
80: Registration data exists (for connection)

- Designate the applicable data (for 1 data) for the above registration data byte count when registering the data for initialization or data for connection in the buffer memory.
- For more information on how to register data for initialization or data for connection in the buffer memory, refer to the following sections.  
( Page 209 Register/read/delete data for initialization,  Page 213 Register/read/delete data for connection)

- Modem initialization DR (DSR) signal enable/disable designation (Un\G8200)

Set "DR signal enabled" for this setting.

This setting is used to designate how the DR (DSR) signal is treated only when modem initialization is performed. Following the completion of modem initialization, data is sent according to the status of the DR (DSR) signal.

Set "Turn ON/OFF X13, X14" (default value) for this setting.

### ■Line disconnection wait time (for PLC CPU monitor) (Un\G8206)

- When transmitting data using the programmable controller CPU monitoring function, designate the time between data transmission from C24 and completion of data transmission from the modem on the host station side to the target device side (wait time to disconnect the line).
- Specify the line disconnection wait time in accordance with the specifications of the modem to be used.

### Details of buffer memory (for the remote password function)

Each of the areas described below is valid when C24 performs the remote password check.

### ■Remote password mismatch notification count designation (Un\G8204)

- Designate the count that will be the timing to notify the CPU module that a remote password mismatch occurred during the unlock processing by the user/target device after the modem line has been connected with 0 to FFFFH.
- Confirming the accumulated number of times of occurred remote password mismatch up to the present time after the line connection is not available.

### ■Remote password mismatch notification accumulated count designation (Un\G8205)

- Designate the accumulated count that will be the timing to notify the CPU module that a remote password mismatch occurred during the unlock processing by the user/target device after C24 has been started up with 0 to FFFFH.
- The accumulated number of times remote password mismatch occurred up to the present time from C24 startup (accumulated count value by C24) can be checked in the 'Accumulated count of unlock process abnormal completion' (Un\G8956).

### ■Accumulated count of unlock process normal completion (Un\G8955)

The accumulated number of times the remote password unlock process has been completed normally is stored.

### ■Accumulated count of unlock process abnormal completion (Un\G8956)

The accumulated number of times the remote password unlock process has been completed abnormally is stored.

### ■Accumulated count of lock process by line disconnection (Un\G8959)

The accumulated number of times C24 has automatically performed the lock processing due to a modem line disconnection is stored.

#### Point

The supplemental information for each of the accumulated count stored in Un\G8955, 8956, and 8959 is shown below:

- The value can be cleared by writing "0" to the corresponding area of the buffer memory.
- The accumulated count will be stored as 0H → 1H → 2H ... → FFFFH → 0H → 1H → ...

## Considerations for using the modem function

Considerations for using the modem function to perform data communication with a target device via public line are shown below.

### Modem connection and disconnection

When performing data communication with a target device, it must be predetermined which station is to perform the line connection (dialing) and disconnection processing with the target device as well as the timings.

### Reception data before connection completion

Until the connection processing to the modem is completed, the received data other than modem commands is ignored (read and discarded) at the interface that uses the modem function.

(Example) C24 will ignore the data even when an MC protocol command message is received.

### Transmission control

Delays may occur in transmission controls to notify the data reception capability at the host station to the target device.

The amount of transmitted/received data and the interval must be determined beforehand in order to prevent any conditions in which the target device cannot receive transmitted data.

When transmitting/receiving data in the nonprocedural protocol, the procedure must also be predetermined.

### Priority of data communication

The data transmission/reception processing with the target device after line connection has been established is performed in the order of the processing request occurrence.

At the same time, when the line disconnection processing or data transmission/reception (including data transmission processing, reception processing and flash ROM access processing) occurs, the line disconnection processing has the priority.

### Data communication time

The data transmission/reception time after line connection has been established with the target device is the total time of the transmission time between C24 and modem/TA, between modem and TA, and between modem/TA and target device.

When communicating via the MC protocol, the transmission time (such as T0 and T3) must include the transmission time between the modem/TA on the C24 side and the target device.

For details, refer to the following manual.

 MELSEC Communication Protocol Reference Manual

### Initial Settings

The data for connection, which is used for the modem function, can be registered as follows depending on how to set.

Set the telephone number and message within the allowable number of registration characters for modem/TA.

#### ■Registering using Engineering tool

- Up to 254 bytes can be set for comments. (Not used for control.)
- Up to 62 bytes can be set for telephone number.

#### ■Registering by the CPU module (program)

- Comments cannot be set.
- Up to 18 bytes can be set for telephone number.

### Programmable controller CPU monitoring function

For considerations for transmitting monitored results with the modem function, refer to the following section.

 Page 179 Modem connection error

## Remote password check

### ■How to unlock the remote password

- When C24 has been set as a subject to the remote password check with the CPU module parameter, a remote password unlock processing must be performed from the target device after line connection before starting data communication.
- The unlock processing for the CPU module remote password is performed as follows:  
When communicating using MC protocol: Perform the unlock processing from the target device using dedicated commands.

### ■When the remote password unlock processing is completed abnormally

- Repeat the unlock processing after checking the remote password set in the CPU module.
- Start with the line connect processing again if C24 'Connection' (X12) turns OFF due to the unlock processing abnormal completion.
- Perform the line connect processing again after clearing the accumulated count stored in the following buffer memory when the 'CH□ Error occurrence' (XE/XF) of C24 turns ON and the ERR LED lights up due to the unlock processing abnormal completion.  
(Target buffer memory)  
'Accumulated count of unlock process abnormal completion' (Un\G8956)  
(How to clear)  
Write "0" to the relevant area of the buffer memory.

### ■When the number of times remote password mismatch occurs is large

- When the number of times notification of a remote password mismatch is received exceeds the 'Remote password mismatch notification count designation' (Un\G8204), C24 disconnects the line automatically. (The 'Connection' (X12) turns OFF.)  
After confirming the remote password registered in the CPU module and the remote password specified in the target device, restart from the line connection.
- When the count exceeds the 'Remote password mismatch notification accumulated count designation' (Un\G8205), C24 performs the following processing every time the mismatch occurs (The line to the modem is not disconnected.)  
An error code (7FE8H) is stored in the 'MC protocol send error code' (Un\G602/618) on the buffer memory.  
The 'CH□ Error occurrence' (XE/XF) turns ON and the ERR LED turns ON.
- The accumulated number of times remote password mismatch occurred up to the present time (accumulated count value by C24) can be checked in the 'Accumulated count of unlock process abnormal completion' (Un\G8956).
- The accumulated number of times up to the present time should be cleared by writing "0" to the 'Accumulated count of unlock process abnormal completion' on the buffer memory (Un\G8956).

#### Point

- If the 'CH□ Error occurrence' (XE/XF) for C24 turns ON and the ERR LED turns ON, this may indicate improper access from the target device. Refer to "CPU module side countermeasures against improper access from a target device".  
( Page 200 CPU module side countermeasures against unauthorized access from a target device)
- For details on how to turn OFF the ERR LED of C24, refer to the following manual.  
( Page 492 Turning OFF the ERR LED and initializing the error codes)
- 'CH□ Error occurrence' (XE/XF) turns OFF when the data transmission/reception processing is performed normally.

## CPU module side countermeasures against unauthorized access from a target device

The following is an example of performing, on the programmable controller CPU side, the line disconnect processing against the target device and prohibiting receive via a modem when the number of "remote password mismatch" detected by the C24 remote password check function exceeds the number set by the user.

- Determine at the user side the count and accumulated count for notification when a remote password mismatch occurs in the unlock processing from external devices with respect to the remote password set in the CPU module.  
( Page 197 Details of buffer memory (for the remote password function))
- Set the above counts to the items below for the module parameters in order for C24 to operate, and register them in C24.  
Set in "Remote password mismatch notification count."  
Set in "Remote password mismatch notification accumulated count."
- In addition to initialization commands used in normal modem initialization, specify "No automatic receive" and additionally register the modem initialization command for this step to C24. (No automatic receive: This is the setting to prohibit line connection from the target device.)
- Constantly monitor the rise (OFF → ON) of the 'CH1 Error occurrence' (XE/ XF) when connecting the line to the target device using the modem function after the system begins operating.
- Monitor the following buffer memory when the error occurred signal turns ON.  
'MC protocol send error code' (Un\G602)
- Perform the line disconnect processing to the target device when the error code stored in the above buffer memory is 7FE8H.  
(Use the 'Modem disconnection request' (Y12).)
- After the above line disconnection processing is completed, specify the modem initialization command for which "No automatic receive" has been specified and perform modem initialization only. ( Page 231 Data communication)
- Describe the above occurrence to the system manager and take necessary measures.

### ■Program example

When the number of times a remote password mismatch occurred exceeds the notification accumulated count setting value during the remote password unlock processing in communication using MC protocol with the C24 CH1 side interface used.

## Number of modules for which the remote password check can be set

Up to eight modules can be registered as the remote password applicable module in the CPU module. <sup>\*1</sup>

For the settings of the remote password applicable module, use the "Remote Password Setting" screen of Engineering tool.

<sup>\*1</sup> The remote password applicable modules are as follows:

- C24
- Ethernet module
- Built-in Ethernet port CPU module

## 9.4 Startup of the Modem Function

This section explains the startup procedures, processing methods and programming when the modem function of C24 is used.

### Startup procedure of the modem function

The following shows the procedure to start the modem function and start data communications.

#### Procedure up to initialization of C24 modem/TA

Initialize the modem/TA connected to C24 in order to use the modem function. Initialization of the modem/TA enables respective communications.

## Initial settings of Serial communication module

This section explains the initial settings of C24 for data communication with a target device by using the modem function.

### Communication protocol setting, Communication speed setting, Transmission setting

\*1 For details on how to register the data No. for initialization, refer to the following section.

☞ Page 209 Register/read/delete data for initialization

For details on how to register the data No. for connection, refer to the following section.

☞ Page 213 Register/read/delete data for connection

\*2 Even if the CPU module on the station with C24 (host station) becomes STOP status under the following circumstances, the line (telephone) with the target devices will be left connected.

To prevent the line from being left connected when the line is not in use, be sure to make the appropriate settings.

· When the CPU module is stopped when the 'Connection' (X12) is in the ON status. (This occurs because the program write after remote stop is enabled.)

· When the CPU module stops abnormally during self-diagnosis, etc.

\*3 The "Modem initialization DR (DSR) signal enable/disable designation" designates whether the status of the DR (DSR) signal output is valid or invalid at the startup of C24 .

· When the DR (DSR) signal = ON is output from the modem, register "valid" for this item.

· When the DR (DSR) signal = ON is not output from the modem, register "invalid" for this item.

## Precautions

- When setting the no-communication interval time to 'Infinite wait' (setting value = 0), be sure to perform line disconnection processing after the data has been communicated.
- Leaving the line connected for long periods of time without performing line disconnection after data communication has been completed not only will run up a large telephone bill but also may violate electronic communication business laws.

### ■ Transmissions using the modem function

All communications using the modem function are performed in full-duplex communications. Leave the following initial settings for the interface side that uses the modem function as default.

- CD terminal check : Do not check
- Communication method: Full-duplex communications

### ■ Processing that corresponds to output signals

The processing to the following output signals cannot be aborted.

| Output signal | Request processing name                  |
|---------------|------------------------------------------|
| Y10           | Initialization request (standby request) |
| Y11           | Connection request                       |
| Y12           | Modem disconnection request              |

Using the following initial settings for the modem function as default is recommended. (When any error occurred, it will end due to the time-out.)

- Connection re-try count: 3 times
- Connection retry intervals : 180 s
- Initialization/connection timeout : 60 s

Also configure the settings for a remote password check when the remote password check is executed to the remote password set in the module CPU. (➡ Page 197 Details of buffer memory (for the remote password function))

## Register/read/delete data for initialization

The section explains the registration/reading/deletion of the data for initialization such as initialization commands for the modem/TA connected to the C24 side for data communication with the target device using the modem function.

### Details of the data for initialization

The following shows the registration destination and type of the data for initialization, registration number, and registration count.

Up to 78 bytes of initialization commands can be registered as one data for initialization. (For 78 characters)

| Registration destination of data for initialization |                 | Types of data for initialization that is registered                    | Registration number of data for initialization | Number of registrations | Remarks                                                                                                                                                                                                              |
|-----------------------------------------------------|-----------------|------------------------------------------------------------------------|------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU module                                          | Built-in memory | Arbitrary data for initialization registered by the user <sup>*1</sup> | 2500 to 2529 (9C4H to 9E1H)                    | 30                      | <ul style="list-style-type: none"> <li>Register the data for initialization after the debug process has been completed.</li> <li>By registering data in this area, replacing C24 can be performed easily.</li> </ul> |
|                                                     | SD memory card  | Arbitrary data for initialization registered by the user <sup>*1</sup> | 2500 to 2529 (9C4H to 9E1H)                    | 30                      | <ul style="list-style-type: none"> <li>Register the data for initialization after the debug process has been completed.</li> <li>By registering data in this area, replacing C24 can be performed easily.</li> </ul> |
| C24                                                 | Flash ROM       | Data for initialization that is registered before shipment             | 2000 to 2013 (7D0H to 7DDH)                    | 13                      | <ul style="list-style-type: none"> <li>☞ Page 210 Registration contents before shipment</li> </ul>                                                                                                                   |
|                                                     |                 | Arbitrary data for initialization registered by the user <sup>*1</sup> | 2500 to 2529 (9C4H to 9E1H)                    | 30                      | <ul style="list-style-type: none"> <li>Register the data for initialization after the debug process has been completed.</li> </ul>                                                                                   |
|                                                     | Buffer memory   | Arbitrary data for initialization registered by the user               | -32767 to -32737 (8001H to 801FH)              | 31                      | <ul style="list-style-type: none"> <li>Register the data for initialization before the debug process has been completed.</li> </ul>                                                                                  |

<sup>\*1</sup> For the priority of the registered data, refer to the following section.

☞ Page 434 PARAMETER REGISTRATION TO CPU MODULE

### Considerations for registration of data for initialization

- Do not include CR/LF (data code : 0DH/0AH) in the data for initialization to be registered to C24.  
The CR/LF is output at the end of the AT command by C24 at the time of the initialization processing (automatically added).
- The registration status of the data for initialization stored in the flash ROM may be checked in the buffer memory (Un\G550 to 552).

For initial registration, register by designating an unregistered number.

When designating a registration number that has already been registered, first delete the registration data for the designated number prior to registration.

## Registration contents before shipment

- The data for initialization registered in the flash ROM of C24 are listed below:

| Registration number |         | Initialization command         | Devices                                                                                                                                                                                |                                |
|---------------------|---------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| Hexadecimal         | Decimal |                                | Manufacturer                                                                                                                                                                           | Model                          |

- If initialization commands other than listed above are needed, register the data for initialization in the flash ROM or the buffer memory of the C24 and use it.

### ■Remarks

- Perform the following setting to the modem/TA connected to the C24 side.  
For settings other than listed below, configure the setting in accordance with the modem/TA specifications.  
Refer to the instruction manual for the model to be used for details.

### ■Setting with Engineering tool

Set with the module extended parameters of C24.

Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ Module Name ⇒ [Module Extended Parameter] ⇒ [Modem initialization data]

### ■For the buffer memory of the C24

- Designate the applicable area corresponding to the registration No., 8001H to 801FH in respect to the area for user frame registration (Un\G6912 to 8128), and write (register)/read the data for initialization.

When deleting the data for initialization, write "0" to the registration data byte count designation area of the applicable number.

- The following shows the overview of buffer memory that are used for writing/reading/deleting processing for data initialization and the setting value of each area.

For more details, refer to the following section. (Refer to it by substituting the user frame to data for initialization.)

- (0) Turn the READY flag ON.
- (3) Designate initialization data registration.
- (6) Set the registration data byte count.  
Set the user control data (control number).  
Set the AT command for initialization to buffer memory.  
Set the initialization flag.

## Register/read/delete data for connection

This section explains the registration/reading/deletion of data for connection such as the telephone number of the target device that are used for communicating data with target devices using the modem function.

### Details of the data for connection

The following shows the registration destination and type of the data for connection, registration number, and registration count.

The maximum number of bytes for data that can be registered as one data for connection is 80 bytes. (Connection data portion: 44 bytes, free: 36 bytes)

| Registration destination of data for connection |                 | Types of data for connection that is registered | Registration number of data for connection | Number of registrations | Remarks                                                                                                                                                                                            |
|-------------------------------------------------|-----------------|-------------------------------------------------|--------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                 | Buffer memory   | Data registered by the user                     | -32767 to -32737 (8001H to 801FH)          | 31                      | <ul style="list-style-type: none"> <li>Register the data for connection after the debug process has been completed.</li> </ul>                                                                     |

<sup>\*1</sup> For the priority of the registered data, refer to the following section.

 Page 434 PARAMETER REGISTRATION TO CPU MODULE

### Considerations for registration of data for connection

- The registration status of the data for connection stored in the flash ROM can be checked in the buffer memory (Un\547 to 549).

For initial registration, register by designating an unregistered number.

When designating a registration number that has already been registered, first delete the registration data for the designated number prior to registration.

## Method to register/read/delete data for connection

### ■Setting with Engineering tool

Set the data using the C24 module extended parameter.

Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ Module Name ⇒ [Module Extended Parameter] ⇒ [Modem connection data]

### ■For the buffer memory of C24

- Designate the applicable area corresponding to the registration No., 8001H to 801FH in respect to the area for user frame registration (Un\G6912 to 8128), and write (register)/read the data for connection.

When deleting the data for connection, write "0" to the registration data byte count designation area of the applicable number.

- The following shows the overview of buffer memory that are used for writing/reading/deleting processing for data connection and the setting value of each area.

For more details, refer to the following section. (Refer to it by substituting the user frame to data for connection.)

- The following shows the data arrangement of the area for data for connection (area corresponding to registration numbers 8001H to 801FH) in the buffer memory that is used to register, read and delete data for connection, as well as the designated values and stored values.

#### ●Connection data portion (44 bytes)

| Data name                     | Designated/stored value and contents                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Number of bytes | Data type |

- (0) Turn the READY flag ON.
- (3) Issue the registration command of data for connection.
- (6) Set the number of registered data bytes.  
Clear the storage device of data for connection.  
Set the connection target telephone number.  
Set the external line outgoing number (send 0).  
Set the line type to 'Tone'.  
Write the data for connection to buffer memory.  
Turn the data for connection registration completion flag ON.

## Initialization of modem/TA (terminal adapter)

This section explains the initialization of the modem/TA connected to C24, used for communicating data with the target device with the modem function.

### Requirements for initialization

Complete the following settings and registration in advance.

- C24 initial settings (  Page 206 Initial settings of Serial communication module)
- Registration of data for initialization when initializing with the data for initialization set by the user (  Page 209 Register/read/delete data for initialization)

Initialization and connection can be performed at the same time by performing the connection processing by designating data for initialization and connection. (  Page 222 Line connection)

### Registering data for initialization using Engineering tool

Registration of the number of data for initialization to initialize the modem connected to the C24 side is performed with Engineering tool.

The following explains the number designated by the "Initialization data number" item and the related buffer memory when "0" is designated as the number of data for initialization.

| Used buffer memory                             |                   |           |         | The number of data for initialization used and buffer memory designated value |                                                                                                 |

\*1 'Output start pointer designation' (Un\G184/344)

The head position (nth) in the send frame number designation area to write the registration number of data for initialization to be transmitted is designated.

1 (transmitting from the 1th) to 100 (transmitting from the 100th)

\*2 'Output quantity designation' (Un\G185/345)

How many data for initialization is transmitted from the designated position in the output start pointer designation area is designated.

1 (transmitting 1) to 100 (transmitting 100)

\*3 The registration number of data for initialization to be used is designated.

·7D0H to 7DDH (2000 to 2013) : Data registered by the operating system

·9C4H to 9E1H (2500 to 2529) : Data registered in the flash ROM by the user

·8001H to 801FH (–32767 to –32737): Data registered in the buffer memory by the user

### Considerations for modem/TA initialization

If the DSR signal from the modem/ TA turns OFF when modem/TA initialization is completed (X10 turns ON), C24 executes initialization processing automatically in accordance with the following.

- When the auto modem initialization is specified

Modem/TA initialization processing is executed in the initialization/connection timeout time interval while the DSR signal is OFF regardless of the ON/OFF status of the 'Modem initialization request' (Y10).

- When the auto modem initialization is not specified

The modem/TA initialization processing is executed when the DSR signal restarts regardless of the ON/OFF status of the 'Modem initialization request' (Y10).

## Automatic modem/TA initialization (Setting with Engineering tool)

By configuring the settings for automatic modem initialization with Engineering tool, modem initialization is executed automatically when C24 starts up.

The 'Modem initialization completion' (X10) turns ON.

### ■Settings for auto initialization of the modem / TA

Select "Automatically initialize" for the auto modem initialization designation of Engineering tool.

### ■Considerations for initializing the modem / TA automatically

- If the modem's initialization processing is completed abnormally, C24 executes the following processing.
    - C24 does not turn ON the 'Initialization/connection abnormal completion' (X13).
    - C24 stores an error code in the 'Modem function error code' (Un\G545).
    - C24 retries the modem initialization automatically by using the initialization/connection timeout time stored in the 'Initialization/connection timeout designation' (Un\G50), and repeats it until the initialization is completed normally.When modem initialization is not completed normally, perform the following, and restart the station where C24 is installed.  
Check the set initialization data number.  
Check the registered contents of the initialization data corresponding to the set initialization data number. (If any abnormal, correct them and register them again.) Check if the power of the modem is turned ON.
  - When the 'Modem disconnection request' (Y12) is used from the C24 side, the 'Modem initialization completion' (X10) turns OFF together with the 'Connection' (X12).
- When connecting to the line again, start from the modem initialization.

#### Point

When the line to C24 is disconnected from the target device side, the C24's 'Modem initialization completion' (X10) does not turn OFF.

When desiring to disable reception by the C24 side's modem, execute line disconnect by the 'Modem disconnection request' (Y12).

## Modem/TA initialization with a program

### ■ I/O signals used for initialization

The 'Modem initialization request' (Y10), 'Modem initialization completion' (X10) and 'Initialization/connection abnormal completion' (X13) are used.

#### Ex.

When initializing the modem connected to CH1 of C24 using two set of data for initialization (registration numbers 8001H and 8002H) that are registered in the buffer memory

## ■Program example

An example of the modem/TA initialization program on the C24 side by the CPU module is shown below.  
(When the data for initialization has been registered with Engineering tool or from the CPU module)

| Category            | Label name                                              | Description                                   | Device                      |

- (0) Turn the READY flag ON.
- (3) Turn the modem initialization applicable flag ON.
- (11) Issue the modem initialization command.
- (14) Set the initialization request signal.  
Set the initialization request flag.
- (18) Set the initialization completion flag.  
Read the error code at initialization abnormal completion.
- (34) Reset the flag with the clear command.

## Line connection

The following explains the connection (dialing) with target devices for data communication with target devices using the modem function.

### Requirements for connection

Complete the following settings and registration in advance.

- The initial settings for C24 (  Page 206 Initial settings of Serial communication module)
- The registration of the data for initialization (  Page 209 Register/read/delete data for initialization)
- The registration of data for connection (  Page 213 Register/read/delete data for connection)
- The initialization of the modem/TA connected to C24 side (  Page 217 Initialization of modem/TA (terminal adapter))

In addition, both the initialization and line connection can be conducted simultaneously by designating the data for initialization and data for connection to perform connection processing.

For setting of data for initialization to perform initialization and line connection simultaneously, refer to the following sections. It is not explained in this section.

 Page 206 Initial settings of Serial communication module

 Page 217 Initialization of modem/TA (terminal adapter)

### Registering the data for connection using Engineering tool

The number for the data for connection that is used for line connection in order to perform data communication with the target device is registered with Engineering tool.

#### ■When line connecting from the C24 side

Designate the registration number of the data for connection to be used for "Data No. for connection designation".

 Navigation window ⇒ [Parameter] ⇒ [Module Information] ⇒ Module Name ⇒ [Module Parameter] ⇒ "Application Settings" ⇒ "Modem function setting"

- BB8H to BD5H (3000 to 3029) : Data registered in the flash ROM by the user
- 8001H to 801FH (–32767 to –32737): Data registered in the buffer memory by the user

#### ■When line connecting from the target device

Since the line connection processing is not necessary on the C24 side, registration of data for connection to connect the line and number setting of data for connection are not required.

## Input/output signals used for line connection

'Connection request' (Y11), 'Dialing' (X11), 'Connection' (X12) and 'Initialization/connection abnormal completion' (X13) are used.

**Ex.**

When performing the line connection only from the C24 side after the completion of initialization

\* Connection channel and retry operation are performed using the buffer memory setting.

**Ex.**

When performing the initialization and the line connection from the C24 side simultaneously

\* Connection channel and retry operation are performed using the buffer memory setting.

\*1 Page 217 Initialization of modem/TA (terminal adapter)

**Ex.**

When performing the line connection from the target device after the completion of initialization

**Point**

- The connection channel on the C24 side is set in the module parameter.
- Abnormal processing when the target device initiate the line connection is left entirely to the target device. There is no method on the C24 side to check a line connection error occurrence at the target device.
- When a remote password check is performed for the CPU module, normal completion of the unlock processing enables data communication thereafter.

## Considerations during the line connection

- Prior to data communication with target devices, determine when and which station will perform the line connection (dialing) and line disconnection processing to the target device.
- Use the following method to perform the unlock processing for the CPU module remote password from the target device. During communication using MC protocol, transmit the dedicated command to the C24 side.  
For countermeasures against abnormal completion of the unlock processing, refer to the following section.  
(☞ Page 199 When the remote password unlock processing is completed abnormally)
- When reconnecting the line after disconnection, allow several seconds for the modem before turning ON the 'Connection request' (Y11).  
If it (Y11) is turned ON immediately after line disconnection, the modem may not accept the first connection request, resulting in connection failure, and may require to wait the retry time.

## Line connection program

An example of a line connection program is shown below.

### ■Program example (When establishing the line connection from the C24 side following the completion of initialization)

When the data for connection has been registered with Engineering tool or from the CPU module

- Registration of data for initialization
- Registration of data for connection
- Modem/TA initialization

- (0) Turn the READY flag ON.
- (3) Turn the line connection available flag ON.
- (11) Register data for initialization.  
to  Page 212 Program example
- (14)
- (41) Register data for connection.  
to  Page 216 Program example
- (44)
- (75) Modem/TA initialization  
to  Page 220 Program example
- (90)
- (106) Issue the line connection command.
- (109) Set the connection request signal.
- (113) Set the connection completion flag when the connection signal is turned ON (normal completion).  
Read the error code at connection error.
- (129) Reset the flag with the clear command.

## ■Program example (When performing the initialization and the line connection from the C24 side simultaneously)

When the data for initialization and connection have been registered with Engineering tool or from the CPU module

• Registration of data for initialization

• Registration of data for connection

(0) Turn the READY flag ON.

(3) Turn the line connection available flag ON.

(12) Register data for initialization.  
to  Page 212 Program example

(15)

(42) Register data for connection.  
to  Page 216 Program example

(45)

(76) Issue the line connection command.

(79) Set the connection request signal.

(83) Set the connection completion flag when the connection signal is turned ON (normal completion).  
Read the error code at connection error.

(100) Reset the flag with the clear command.

---

When the line connection is initiated from the target device, any of the registration, setting or connection processing related to the line connection is not necessary.

Data communication is available when the 'Connection' (X12) turns ON after the completion of the C24 modem/TA initialization.

☞ Page 223 Input/output signals used for line connection

For program example of the modem/TA for initialization, refer to the following section.

☞ Page 219 Modem/TA initialization with a program

---

## Data communication

The following explains the considerations for data communication with target devices using the modem function.

### Requirements for data communication

#### ■When communicating data with target devices

Perform the appropriate processing up to line connection or modem/TA initialization, depending on whether or not the line connection is initiated from the C24 side.

After line connection, data communication can be performed using an MC protocol/nonprocedural protocol/bidirectional protocol in full-duplex communication.

- When line connecting from the C24 side, complete the processing up to line connection beforehand. (☞ Page 222 Line connection)
- When line connecting from the target device, complete the processing up to the initialization of the modem/TA beforehand. (☞ Page 217 Initialization of modem/TA (terminal adapter))

### Buffer memory and input/output signals to be used

#### ■When communicating data with target devices

Only buffer memory and input/output signals used for data communication (MC protocol/nonprocedural protocol/bidirectional protocol) is used.

Communicate data using the ON of 'Connection' (X12) as the interlock signal.

There is no input/output signal or buffer memory for modem functions used in data communication.

## General procedure

This section explains the general procedure for nonprocedural protocol/bidirectional protocol (executed in full-duplex communication) data communication using the modem function between the CPU modules with C24 installed.

### ■System configuration

### ■General procedure

1. Perform initial setting for C24 at both station A and station B.
2. Perform modem/TA initialization on station B.
3. Perform modem/TA initialization and line connection on station A.
4. Communicate data using the nonprocedural protocol/bidirectional protocol.
5. In order to end the communication, disconnect line from station A that initiated the line connection.

### ■Processing flow

\* It is possible to disconnect line from Station B, as well.

### ■When communicating data with the target device

- When setting the no-communication interval time to 'Infinite wait' (setting value = 0) in the initial setting of C24, be sure to perform line disconnection after the completion of data communication.
- Only the nonprocedural protocol/bidirectional protocol data communication can be performed with the CPU module with C24 installed.
- C24 automatically performs line disconnection processing if no data communication is performed during the no-communication interval time.

The 'Connection' (X12) and the 'Modem initialization completion' (X10) turn OFF and the 'Modem disconnection completion' (X14) turns ON when the line disconnection processing is performed.

# Line disconnection

The following explains the line disconnection upon communication completion when communicating data with the target device using the modem functions.

## Input/output signals to be used

Use the 'Modem disconnection request' (Y12) and 'Modem disconnection completion' (X14).

This is the procedure to take in order to turn off the initialization completion signal (X10).

\* In the case of C24, when the line is disconnected from the target device, the initialization completion signal (X10) at the host station is not turned OFF.

### Point

- There is no buffer memory for line disconnection processing.
- Line disconnection processing can be conducted from either device as long as the connection is in progress.
- The line disconnection processing disconnects the line connection with the target device as well as the connection with the modem on the C24 side.
- Even when an error occurs during the line disconnection, the disconnection processing will be forced.
- When resuming data communication after line disconnection, start from either one of the following processing depending on the 'Modem initialization completion' (X10).  
 'Modem initialization completion' is OFF: Start from the initialization of the modem/TA.  
 'Modem initialization completion' is ON: Start from the line connection with the target device.

## Considerations during the line disconnection

- Prior to data communication with target devices, determine when and which station will perform the line connection (dialing) and line disconnection processing to the target device.
- If the line is disconnected during data transmission, transmission processing will be performed depending on the signal status of the C24 RS-232 interface.
- If the line is disconnected during data reception, data reception will be disabled.

This may cause an error occurrence such as a reception time out.

- When data communication is not performed for the period equivalent to the no-communication interval time designation, C24 will automatically disconnect the line.

When the line is disconnected, the 'Connection' (X12) and the 'Modem initialization completion' (X10) turn OFF, and the 'Modem disconnection completion' (X14) turns ON.

To turn OFF the 'Modem disconnection completion' (X14), turn ON the 'Modem disconnection request' (Y12) for a second after the 'Modem disconnection completion' (X14) turned ON.

## Program for line disconnection

A program example for line disconnection is shown below.

## ■Program example

- (91)
- (107) Line connection  
to [Page 226 Program example](#) (When establishing the line connection from the C24 side following the completion of initialization)
- (130)
- (133) Turn the data update available flag ON.
- (137) Turn the line disconnection available flag ON.
- (146) Issue the line disconnection command.
- (149) Set the modem disconnection request signal.
- (154) Read the error code when modem disconnection completion signal is turned ON.  
Set the modem disconnection completion flag after the normal completion.
- (172) Reset the modem disconnection request signal.
- (181) Line disconnection processing (line disconnection from the target device)
- (184) Reset the request signals.  
Set the modem disconnection request signal when either of completion signal or connection signal is turned ON.
- (193) To turn the 'Modem disconnection completion' (X14) OFF, wait for one second after the 'Modem disconnection request' (Y12) is turned ON.
- (201) Reset the request signal when the modem disconnection completion signal is turned ON.  
Reset the request signal when the modem disconnection completion signal is turned OFF.

# 9.5 Sample program

## Program for data communication

The following shows sample programs to test the connection between C24s.  
Each program contains a minimum set of processing necessary for performing a communication test.  
Modify the data for initialization and data for connection in accordance with the system. When adding error-handling procedures, add them separately by referring to the following explanations.

### System configuration

The system configuration used in this program is shown below.

### Connection request station side (RJ71C24-R2①) program example

Perform the initialization of the modem connected to the CH1 side interface, line connection, data communication using the nonprocedural protocol, and line disconnection by the command from the user.

#### Parameter list

The following shows the parameters of this sample program.

- Module parameter

| Category             | Setting item                                       |                                |                                         | Setting content        |

| Label to be defined                           | Define the global label as shown below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                       |                       |       |                       |
